1. Introduction

Thank you for purchasing your Wireless 802.11a+g AP Router.

This user guide will assist you with the installation procedure.

The package you have received should contain the following items:

- TEW-511BRP Wireless 802.11a+g AP Router
- Quick Installation Guide
- User Manual CD-ROM
- Dual Diversity Detachable Antennas
- External Power Adapter (5V, 2.5A)
- RJ-45 Network Cable

Note: if anything is missing, please contact your vendor

2. Safety Notification

Your Wireless AP Router should be placed in a safe and secure location. To ensure proper operation, please keep the unit away from water and other damaging elements. Please read the user manual thoroughly before you install the device. The device should only be repaired by authorized and qualified personnel.

- Please do not try to open or repair the device yourself.
- Do not place the device in a damp or humid location, i.e. a bathroom.
- The device should be placed in a sheltered and non-slip location within a temperature range of +5 to +40 Celsius degree.
- Please do not expose the device to direct sunlight or other heat sources. The housing and electronic components may be damaged by direct sunlight or heat sources.

3. Hardware Installation

Front Panel

The front panel provides LED's for device status. Refer to the following table for the meaning of each feature.

Power	The Power LED lights up and will keep while the Router is powered on. When the Router goes through its self-diagnostic mode during every boot-up, this LED will flash. When the diagnostic is complete, the LED will be lit continuously.
DMZ	The DMZ LED indicates when the DMZ function is being used. This LED will remain lit as long as DMZ is enabled.
11a	The 11a LED flashes when there is a successful Wireless-A connection.
11g	The 11g LED flashes when there is a successful Wireless-G connection.
Ethernet	LED 1, 2, 3, 4. These numbered LEDs, corresponding with the numbered ports on the Router's rear panel. If the LED is continuously lit, the Router is successfully connected to a device through that port. A flashing LED indicates network activity over that port.
Internet	The Internet LED lights up when there is a connection built through the Internet port.

Rear Panel

The rear panel features 4 LAN ports, 1 WAN port and Reset button. Refer to the following table for the meaning of each feature.

RESET Button	The RESET button can restore device to factory default settings by press this button for approx. 10 seconds during device power on status.
Internet	The Internet port is where you will connect your broadband Internet connection.
LAN 1,2,3,4	These ports (1, 2, 3, 4) connect the Router to your networked PCs and other Ethernet network devices.
Power	The POWER port is where you will connect the power adapter.

AP Router Default Settings

User	
Password	admin
IP Address	192.168.1.1
Subnet Mask	255.255.255.0
RF ESSID	A band: wlan-a G band: wlan-g
Channel	A band: Auto G band: 6
Mode	G band: Mixed
Encryption	Disabled
DHCP Server	Enabled

Hardware Installation for Connection to Your Broadband Modem

1. Power off your network devices.
2. Locate an optimum location for the Router. The best place for the Router is usually at the center of your wireless network, with line of sight to all of your wireless devices.
3. Adjust the antennas. Normally, the higher location of your Router will get better the performance.
4. Using a standard Ethernet network cable, connect the Router's Internet port to your broadband modem.
5. Connect your network PCs or Ethernet devices to the Router's LAN ports using standard Ethernet network cabling.
6. Connect the AC power adapter to the Router's Power port. Then connect the other end to an electrical outlet. Only use the power adapter supplied with the Router. Use of a different adapter may cause product damage.
7. The Hardware installation is complete, please refer to the following content for Router configuration.

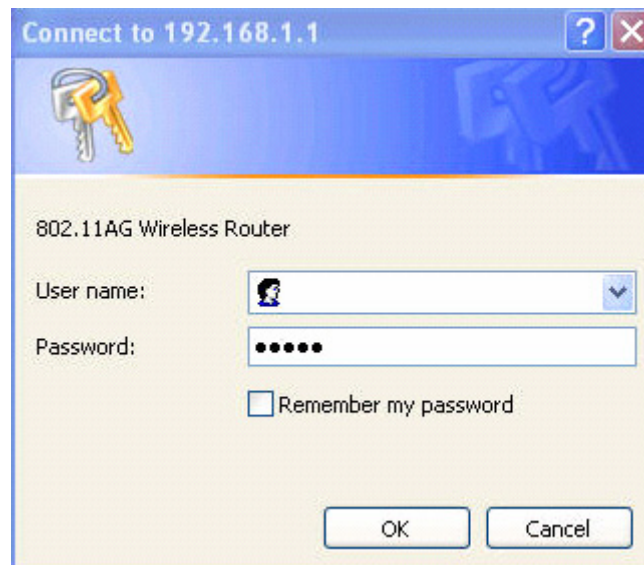

4. How to Configuring the Dual Band Router

TURN ON POWER SUPPLY

Quick power cycle would caused system corruption. When power on, be careful not to shut down in about 5 seconds, because data is writing to the flash.

START UP & LOGIN

In order to configure the Wireless 11ag Router, you must use web browser and manually input `http://192.168.1.1` into the Address box and press Enter. The Main Page will appear.

In order to configure the Wireless 11ag Router, you must input the password into the **Password** box and leave blank on the **User Name** box. The default password is "**admin**".

Once you have logged-in as administrator, it is a good idea to change the administrator password to ensure a secure protection to the Wireless 11ag Router. The Security Settings section described later in this manual describes how to change the password.

Once you have input the correct password and logged-in, the screen will change to the Setup page screen.

4.1 Setup – Basic Setup

MAKE CORRECT NETWORK SETTINGS OF YOUR COMPUTER

To change the configuration, use Internet Explorer (IE) or Netscape Communicator to connect the WEB management 192.168.1.1.

This following screen contains all of the Router's basic setup functions.

Most users will be able to configure the AP Router and get it working properly using the settings on this screen. Some Internet Service Providers (ISPs) will require that you enter broadband specific information into this device, such as User Name, Password, IP Address, Default Gateway Address, or DNS IP Address for Internet access. This information can be obtained from your ISP, if required.

Internet Setup

Internet Connection Type:

◆ Automatic Configuration – DHCP

This' s default connection type. If your ISP supports DHCP assigning dynamic IP address then please select this type.

◆ Static IP

If you are required to use a fixed IP address to connect to the Internet, then select **Static IP**.

Internet IP Address: This' s the Router's WAN IP address. Usually it will provide by your ISP, and need to input here.

Subnet Mask: This' s the Router's Subnet Mask, Usually it will provide by your ISP, and need to input here.

Default Gateway: This' s the Router's Gateway Address, Usually it will provide by your ISP, and need to input here.

DNS (1-3): Your ISP will provide you at least one DNS Server IP Address and need to input here.

◆ PPPoE

PPPoE (Point-to-Point Protocol over Ethernet) is one of Internet connections type. If you are connected to the Internet through a DSL line, check with your ISP to see if they use PPPoE type. If yes, you will have to enable PPPoE.

User Name and Password: Enter the User Name and Password provided by your ISP.

Connect on Demand: The Max Idle Time means the Router will disconnect the Internet connection if there is no any traffic through this Router during a specified period time. If your Internet connection has been terminated due to over this idle time, the Connect on Demand option will trigger the Router to automatically re-establish your connection as soon as you try to access the Internet again.

Keep Alive: The Redial Period means the Router will periodically check your Internet connection by Redial Period time. If the connection is disconnected, then the Router will redial automatically for your connection.

◆ PPTP

Point to Point Tunneling Protocol (PPTP), is one of VPN tunnel that can use to encrypt data and prevent the unauthorized viewing of confidential data that is transmitted across publish networks.

Internet IP Address and Subnet Mask: This' s the Routers IP Address and Subnet Mask. If your Internet connection requires a static IP address, then your ISP will provide you a Static IP Address and Subnet Mask for input here.

Default Gateway: Your ISP will provide you with the Gateway IP Address.

User Name and Password: This' s PPTP login User Name and Password. Your ISP will provide you such information for input here.

Keep Alive: The Redial Period means the Router will periodically check your Internet connection by Redial Period time. If the connection is disconnected, then the Router will redial automatically for your connection.

These types can be selected from the Internet Connection Type drop-down menu. The information required and available features with minor different that depend on what kinds of connection type you are selected.

Optional Settings

These settings may be required by your ISP. If your ISP would provide such information, please note to specify them into your device.

Host Name and Domain Name: These fields allow you to input a host and domain name for the Router. Some ISPs require these names as identification. You may have to check with your ISP to see if your broadband Internet service has been configured with a host and domain name. In most cases, leaving these fields blank will work.

MTU: MTU is the Maximum Transmission Unit. It specifies the largest packet size permitted for Internet transmission. Select **Manual** if you want to manually enter the largest packet size that will be transmitted. The recommended size, entered in the *Size* field, is 1500. You should leave this value in the 1200 to 1500 range. To have the Router select the best MTU for your Internet connection, please select the default setting--**Auto**.

Network Setup

The Network Setup section changes the Router's local network settings.

Router IP

IP Address and Subnet Mask. This' s Router's LAN IP Address and Subnet Mask. The default IP Address is **192.168.1.1** and the default Subnet Mask is **255.255.255.0**.

DHCP Server Settings

The settings allow you to configure the Router's Dynamic Host Configuration Protocol (DHCP) server function. The Router can be used as a DHCP server for your network. A DHCP server automatically assigns an IP address to each computer on your network. If you choose to enable the Router's DHCP server option, you must make sure there is no other DHCP server on your network. If you disable the Router's DHCP server function, you must configure the IP Address, Subnet Mask, and DNS for each network computer (note that each IP Address must be unique).

DHCP Server: DHCP is enabled by factory default. If you already have a DHCP server on your network or you do not want a DHCP server, then select **Disable** from the options.

Assign Static DHCP: The function can enable DHCP server to assign a same IP address for appointed PC. If you want a PC to be assigned the same IP address every time when it reboots, then click the **Assign Static IP** button.

How to set a PC as Static DHCP client

On the *Static DHCP Client List* screen, enter the static local IP address in the *Assign this IP* field, and enter the MAC address of the PC in the *To this MAC* field. Then click the **Enabled** checkbox. When you have finished your entries, click the **Save Settings** button to save your changes.

Click the **Cancel Changes** button to cancel your changes. To exit this screen, click the **Close** button.

How to set a DHCP client as Static DHCP client

Click the **DHCP Client Table** button can see a list of DHCP client. On the *DHCP Client Table*, you will see a list of DHCP clients with the following information: Client Names, Interfaces, IP Addresses, and MAC Addresses. From the *To Sort by* drop-down menu, you can sort the table by Client Name, Interface, IP Address, or MAC Address. If you want to add any of the DHCP clients to the Static DHCP Client List, then click the **Save to Static DHCP Client List** checkbox and then click the **Save Settings** button. Click the **Cancel Changes** button to cancel your changes. To view the most up-to-date information, click the **Refresh** button. To exit this screen, click the **Close** button.

Start IP Address: Enter a value for the DHCP server to start with when issuing IP addresses. Because the Router's default IP address is 192.168.1.1, the Starting IP Address must be 192.168.1.2 or greater, but smaller than 192.168.1.254. The default Starting IP Address is **192.168.1.100**.

Maximum Number of Users: Enter the maximum number of PCs that you want the DHCP server to assign IP addresses to. The absolute maximum is 253 - possible if 192.168.1.1 is your starting IP address. The default is **50**.

IP Address Range: The range of DHCP addresses. This range is according to the setting of Maximum Number of Users.

Client Lease Time: The Client Lease Time is the amount of time a network user will be allowed connection to the Router with their current dynamic IP address. Enter the amount of time, in minutes, that the user will be "leased" this dynamic IP address. Once the leased time is up, the user will get a new dynamic IP address automatically. The default is 0 minutes, which means one day.

Static DNS 1-3: The Domain Name System (DNS) is how the Internet translates domain or website names into Internet addresses or URLs. Your ISP will provide you with at least one DNS Server IP Address. If you wish to utilize another, enter that IP Address in one of these fields. You can enter up to 3 DNS Server IP Addresses here. The Router will use these for quicker access to functioning DNS servers.

WINS: The Windows Internet Naming Service (WINS) manages each PC's interaction with the Internet. If you use a WINS server, enter that server's IP Address here. Otherwise, leave this blank.

Time Settings

Change the time zone in which your network functions from this pull-down menu. Click the checkbox if you want the Router to automatically adjust for daylight savings time.

Change these settings as described here and click the **Apply** button to apply your changes or click **Cancel** to cancel your changes. For additional information, click **Help**.

4.2 Setup – DDNS

The Router offers a Dynamic Domain Name System (DDNS) feature. DDNS lets you assign a fixed host and domain name to a dynamic Internet IP address. It is useful when you are hosting your own website, FTP server, or other server behind the Router. Before using this feature, you need to sign up for DDNS service with one of two DDNS service providers, DynDNS.org or TZO.

DynDNS service

To enable DDNS Service using DynDNS.org, follow these instructions:

1. On the *DDNS* screen, select **DynDNS.org** from the *DDNS Service Provider* drop-down menu.
2. Sign up for DynDNS service at www.dyndns.org for applying one DDNS account. Write down your account information.
3. Complete the *User Name*, *Password*, and *Host Name* fields.
4. Click the **Apply** button to save your changes. Click the **Cancel** button to cancel unsaved changes.

The screenshot shows the DDNS configuration interface for DynDNS.org. The page has a navigation bar with tabs for Setup, Wireless, Security, Access Restrictions, Applications & Gaming, Administration, and Status. Under the Setup tab, there are sub-tabs for Basic Setup, DDNS, MAC Address Clone, and Advanced Routing. The DDNS Service dropdown menu is set to DynDNS.org. The form includes fields for Username, Password, and Host Name. The Internet IP Address is displayed as 210.66.97.127. The Status field is empty. At the bottom, there are buttons for Apply, Cancel, and Help.

TZO service

To enable DDNS Service using TZO, follow these instructions:

1. On the *DDNS* screen, select **TZO.com** from the *DDNS Service Provider* drop-down menu.
2. Sign up for a free, 30-day trial of TZO service at www.tzo.com/order.html. Write down your account information.
3. Complete the *Email Address*, *TZO Password Key*, and *Domain Name* fields.
4. Click the **Apply** button to save your changes. Click the **Cancel** button to cancel unsaved changes.

The screenshot shows the DDNS configuration interface for TZO.com. The page has a navigation bar with tabs for Setup, Wireless, Security, Access Restrictions, Applications & Gaming, Administration, and Status. Under the Setup tab, there are sub-tabs for Basic Setup, DDNS, MAC Address Clone, and Advanced Routing. The DDNS Service dropdown menu is set to TZO.com. The form includes fields for E-mail Address, TZO Password, and Domain Name. The Internet IP Address is displayed as 210.66.97.127. The Status field is empty. At the bottom, there are buttons for Apply, Cancel, and Help.

Internet IP Address: The Router's current Internet IP Address is displayed here.

Status: The status of the DDNS service connection is displayed here.

Change these settings as described here and click the **Apply** button to apply your changes or click **Cancel** button to cancel your changes. For additional information, click **Help**.

4.3 Setup – MAC Address Clone

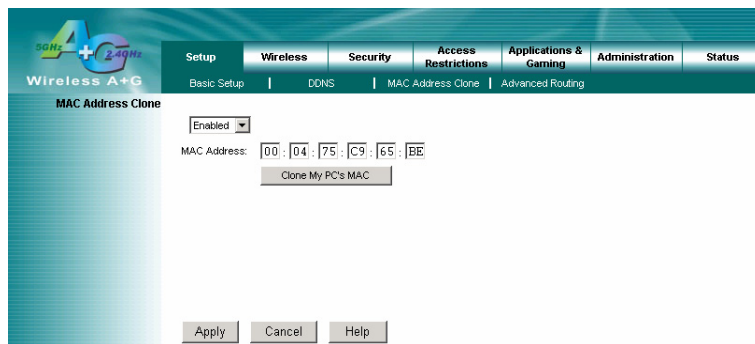

A MAC address is a 12-digit code assigned to a unique piece of hardware for identification. Some ISPs will require you to register a MAC address in order to access the Internet. If you do not wish to re-register the MAC address with your ISP, you may assign the MAC address you have currently registered with your ISP to the Router with the MAC Address Clone feature.

MAC Address Clone

Enabled/Disabled: To have the MAC Address cloned, select **Enabled** from the drop-down menu.

MAC Address: Enter the MAC Address registered with your ISP here.

Clone My PC's MAC: Clicking this button will clone the MAC address of the PC you are currently using.

Change these settings as described here and click the **Apply** button to apply your changes or click **Cancel** button to cancel your changes. For additional information, click **Help**.

4.4 Setup – Advanced Routing

The Advanced Routing is used to set up the Routers advanced functions. Operating Mode allows you to select the type of routing functions. Dynamic Routing will automatically adjust how packets travel on your network. Static Routing sets up a fixed route to another network destination.

Operating mode:

If this Router is hosting your networks connection to the Internet, select **Gateway**. If another Router exists on your network, select **Router**. When Router is chosen, Dynamic Routing will be **enabled**.

Dynamic Routing

This feature enables the Router to automatically adjust to physical changes in the networks layout and exchange routing tables with the other router(s). The Router determines the network packets route based on the fewest number of hops between the source and the destination. This feature is **Disabled** by default.

Static Routing

To set up a static route between the Router and another network, select a number from the *Static Routing* drop-down list. (A static route is a pre-determined pathway that network information must travel to reach a specific host or network.) Enter the information described below to set up a new static route. (Click the Delete This Entry button to delete a static route.)

- ◆ **Destination LAN IP:** The Destination LAN IP is the address of the remote network or host to which you want to assign a static route.
- ◆ **Subnet Mask:** The Subnet Mask determines which portion of a Destination LAN IP address is the network portion, and which portion is the host portion.
- ◆ **Default Gateway:** This is the IP address of the gateway device that allows for contact between the Router and the remote network or host.
- ◆ **Interface** - This interface tells you whether the Destination IP Address is on the **LAN & Wireless** (internal wired and wireless networks) , **WAN** (Internet) or **Loopback** (a dummy network in which one PC acts like a network— necessary for certain software programs)..

Show Routing Table

Click the **Show Routing Table** button to view all of the valid route entries in use. The Destination IP address, Subnet Mask, Gateway, and Interface will be displayed for each entry. Click the **Refresh** button to refresh the data displayed or click the **Close** button to close the window.

The screenshot shows the router's configuration interface. In the 'Advanced Routing' section, 'Operating Mode' is set to 'Router', 'Dynamic Routing (RIP)' is set to 'Enable', and 'Static Routing' is set to '1'. The 'Static Routing' fields are: 'Enter Route Name:' (empty), 'Destination LAN IP:' (0 . 0 . 0 . 0), 'Subnet Mask:' (0 . 0 . 0 . 0), 'Default Gateway:' (0 . 0 . 0 . 0), and 'Interface:' (LAN & Wireless). A 'Show Routing Table' button is present. To the right, a 'Routing Table' window is open, displaying a table with the following data:

Destination LAN IP	Subnet Mask	Gateway	Interface
127.0.0.1	0.0.0.0	127.0.0.1	LoopBack
192.168.1.0	255.255.255.0	192.168.1.25	LAN & Wireless

Below the table are 'Refresh' and 'Close' buttons.

Change these settings as described here and click the **Apply** button to apply your changes or click **Cancel** button to cancel your changes. For additional information, click **Help**.

4.5 Wireless – Basic Wireless Settings

Wireless Network

Wireless-A Settings

If you are using a Wireless-A network, then the following settings that you may need to configure.

Mode: This mode is controlling the Wireless-A (802.11a) networking, **Enabled** or **Disabled**.

Turbo Mode: Using this mode enables high-speed connections but severely limits range. To perform this Turbo Mode, both the Router and wireless PCs must support this function. Turbo Mode is Atheros proprietary technology, so it does not compatible with non-Atheros chipset Wireless LAN device, only with Atheros Wireless-A turbo adapters. To increase the speed of your wireless transmissions up to 108 Mbps, select **Enabled**. (Note: the Router's range will decrease in Turbo Mode.) If you do not want to use Turbo Mode, select **Disabled**.

Network Name (SSID): The service set identifier (SSID) or network name. It is case sensitive and must not exceed 32 characters, which may be any keyboard character. You shall have selected the same SSID for all the APs that will be communicating with mobile wireless stations.

Channel: Select the appropriate channel from the list provided to correspond with your network settings. You shall assign a different channel for each AP to avoid signal interference. If you want the Router to automatically scan for a clear channel, then select **Auto (DFS)**.

SSID Broadcast: When wireless clients survey the local area for wireless networks associated, they will detect the SSID broadcast by the Router. To broadcast the Router's SSID, keep the default setting, **Enabled**. If you do not want to broadcast the Router's SSID, then select **Disabled**.

Wireless-G Settings

If you are using a Wireless-B, Wireless-G, or Wireless B+G network, then the following settings that you may need to configure.

Mode: From this drop-down menu, you can select the wireless standards running on your network. If you have both 802.11g and 802.11b devices in your network, keep the default setting ---**Mixed**. If you have only 802.11g devices, select **Wireless-G Only**. If you have only 802.11b devices, select **Wireless-B Only**. If you do not have any 802.11g and 802.11b devices in your network, select **Disabled**.

Network Name (SSID): The service set identifier (SSID) or network name. It is case sensitive and must not exceed 32 characters, which may be any keyboard character. You shall have selected the same SSID for all the APs that will be communicating with mobile wireless stations.

Channel: Select the appropriate channel from the list provided to correspond with your network settings. You shall assign a different channel for each AP to avoid signal interference.

SSID Broadcast: When wireless clients survey the local area for wireless networks to associate with, they will detect the SSID broadcast by the Router. To broadcast the Router's SSID, keep the default setting, **Enabled**. If you do not want to broadcast the Router's SSID, then select **Disabled**.

The screenshot shows the 'Wireless Network' configuration page. It features a navigation bar with tabs for 'Setup', 'Wireless', 'Security', 'Access Restrictions', 'Applications & Gaming', 'Administration', and 'Status'. Below the navigation bar, there are sub-tabs for 'Basic Wireless Settings', 'Wireless Security', 'Wireless MAC Filter', and 'Advanced Wireless Settings'. The 'Wireless-A Settings' section includes: Mode (Enable), Turbo Mode (Disabled), Network Name (SSID) (wlan-a), Channel (Auto (DFS)), and SSID Broadcast (Enabled). The 'Wireless-G Settings' section includes: Mode (Mixed), Network Name (SSID) (wlan-g), Channel (6 - 2.437GHz), and SSID Broadcast (Enabled). At the bottom are 'Apply', 'Cancel', and 'Help' buttons.

Change these settings as described here and click the **Apply** button to apply your changes or click **Cancel** button to cancel your changes. For additional information, click **Help**.

4.6 Wireless – Wireless Security

The Wireless Security settings configure the security of your wireless network. There are three wireless security mode options supported by the Router: WEP (Wired Equivalent Privacy), WPA Pre-Shared Key, WPA RADIUS.

Wireless Security

The security options are the same and independent for your Wireless-A and Wireless-G networks. You can use different wireless security methods for your networks; however, within each network (Wireless-A or Wireless-G), all devices must use the same security method and settings.

Security Mode:

WEP: WEP is a basic encryption method, select a level of WEP encryption, **40/64-bit** or **128-bit**. If you want to use a Passphrase, then enter it in the *Passphrase* field and click the **Generate** button. If you want to enter the WEP key manually, then enter it in the *WEP Key 1-4* field(s). To indicate which WEP key to use, select the appropriate *TX Key* number.

WPA Pre-Shared Key: This security mode offers two encryption methods, TKIP and AES, with dynamic encryption keys. Select the type of encryption method you want to use, **TKIP** or **AES**. Enter the Passphrase, which can have 8 to 63 characters. Then enter the Key Renewal period, which instructs the Router how often it should change the encryption keys.

WPA RADIUS: This security mode must work with a RADIUS server using EAP –TLS or PEAP for user authentication. To use WPA RADIUS, select the type of encryption method you want to use, **TKIP** or **AES**. Enter the RADIUS server's IP address and port number (default is 1812), along with the authentication shared key by the Router and the server. Enter the Key Renewal period, which instructs the Router how often it should change the encryption keys.

The screenshot shows the 'Wireless Security' configuration page. At the top, there is a navigation menu with tabs for 'Setup', 'Wireless', 'Security', 'Access Restrictions', 'Applications & Gaming', 'Administration', and 'Status'. Below the navigation menu, there are sub-tabs for 'Basic Wireless Settings', 'Wireless Security', 'Wireless MAC Filter', and 'Advanced Wireless Settings'. The main content area is titled 'Wireless Security' and is divided into two sections: 'Wireless-A Information' and 'Wireless-G Information'. Each section has a 'Security Mode' dropdown menu, both of which are currently set to 'Disabled'. At the bottom of the page, there are three buttons: 'Apply', 'Cancel', and 'Help'.

4.7 Wireless – Wireless MAC Filter

This function allows administrator to have access control by enter MAC address of wireless devices which transmitting within your wireless network.

Wireless MAC Filter

Access Restrictions

This policy can effectively control each wireless device using the wireless network. Enable this function to filter wireless devices by MAC Address, either permitting or blocking access. If you do not want to filter users by MAC Address, select **Disabled**.

Prevent PCs listed below from accessing the wireless network: Select this option will block selected wireless client by MAC address.

Permit PCs listed below to access the wireless network: Select this option will permit selected wireless client by MAC Address.

Wireless Client List

Wireless Client List: Click the **Wireless Client MAC List** button to display a list of wireless clients by MAC Address. From the *To Sort by* drop-down menu, you can sort the table by Client Name, Interface, IP Address, MAC Address. If you want to add any of the wireless clients to the Wireless MAC Filter List, then click the **On the List** checkbox and then click the **Save Settings** button. Click the **Cancel Changes** button to cancel your changes. To view the most updated information, click the **Refresh** button. To exit this screen, click the **Close** button.

Wireless Client List	
MAC 01:	00:00:00:00:00:00
MAC 02:	00:00:00:00:00:00
MAC 03:	00:00:00:00:00:00
MAC 04:	00:00:00:00:00:00
MAC 05:	00:00:00:00:00:00
MAC 21:	00:00:00:00:00:00
MAC 22:	00:00:00:00:00:00
MAC 23:	00:00:00:00:00:00
MAC 24:	00:00:00:00:00:00
MAC 25:	00:00:00:00:00:00

Change these settings as described here and click the **Save Settings** button to apply your changes or **Cancel Changes** to cancel your changes. For additional information, click **Help**.

4.8 Wireless – Advanced Wireless Settings

This section provides Router's advanced wireless settings. These settings should be adjusted carefully. Any improper settings will affect the Router's wireless performance.

Advanced Wireless

Wireless-A Settings

Authentication Type:

Open System: This is default setting, those wireless clients that NOT use a WEP key for authentication.

Shared Key: This option means the wireless clients use a WEP key for authentication. Shared Key is only available if the WEP option is implemented.

Transmission Rate: The data transmission rate should be set depending on the speed of your wireless network. You can select a proper transmission speeds to fit your wireless clients requirement, or you can select **Auto (Default)** to have the Router automatically adjust one the fastest and suitable data rate to fit network status at the time. Usually this function can be named Auto-Fallback feature. Auto-Fallback will treat one best connection rate between the Router and a wireless client. The default value is **Auto (Default)**.

Transmission Power: This option provides the Router's RF output power adjustment. To minimize the possibility of eavesdropping by unauthorized wireless users, suggest to decrease the transmission power with a needed by your wireless environment. By drop down menu, you can select the appropriate level, **Full (Default)**, **Half**, **Quarter**, **Eighth**, or **Min**. The default is **Full (Default)**.

Frame Burst Mode: This option can trigger your wireless network with higher performance. However, it should depend on the manufacturer of your wireless products, the default is **Enabled**.

Beacon Interval: The Beacon Interval value indicates the frequency interval of the beacon. Enter a value between 20 and 1000. A beacon is a packet broadcast by the Router to synchronize the wireless network. The default value is **100**.

DTIM Interval: This value indicates the interval of the Delivery Traffic Indication Message (DTIM). A DTIM field is a countdown field informing clients of the next window for listening to broadcast and multicast messages. When the Router has buffered broadcast or multicast messages for associated clients, it sends the next DTIM with a DTIM Interval value. Its clients hear the beacons and awaken to receive the broadcast and multicast messages. The default value is **1**.

Fragmentation Threshold: This value specifies the maximum size for a packet before data is fragmented into multiple packets. If you experience a high packet error rate, you may slightly increase the Fragmentation Threshold. Setting the Fragmentation Threshold too low may result in poor network performance. Only minor reduction of the default value is recommended. In most cases, it should remain at its default value of **2346**.

***Beacon interval:** The data transmitted on your wireless network that keeps the network synchronized.*

***DTIM:** A message included in data packets that can increase wireless efficiency.*

***Fragmentation:** Breaking a packet into smaller units when transmitting over a network medium that cannot support the original size of the packet.*

RTS Threshold: Using this setting can regulate your wireless network if you experience any inconsistent data flow situation, only by minor adjustment of the default value, the default value **2346** is recommended. The RTS/CTS mechanism will not be enabled if your wireless network packet less than RTS threshold value. The Router sends Request to Send (RTS) frames to a particular receiving station and negotiates the sending of a data frame. After receiving an RTS, the wireless station responds with a Clear to Send (CTS) frame to acknowledge the right to begin transmission. The RTS Threshold value should keep at its default value of **2346**.

Wireless-G Settings

Authentication Type:

Open System: This is default setting, those wireless clients that NOT use a WEP key for authentication.

Shared Key: This option means the wireless clients use a WEP key for authentication. Shared Key is only available if the WEP option is implemented.

Basic Rate: The Basic Rate setting is not actually one rate of transmission but a series of rates at which the Router can transmit. The Router will announce its Basic Rate to the other wireless devices in your network, so they know

which rates will be used. The Router will also announce that it will automatically select the best rate for transmission. The default setting is **Default**, when the Router can transmit at all standard wireless rates (1-2Mbps, 5.5Mbps, 11Mbps, 18Mbps, and 24Mbps). Other options are **1-2Mbps**, for older wireless technology, and **All**, when the Router can transmit at all wireless rates. The Basic Rate is not the actual rate of data transmission. If you want to specify the Router's rate of data transmission, configure the Transmission Rate setting.

Transmission Rate: The data transmission rate should be set depending on the speed of your wireless network. You can select a proper transmission speeds to fit your wireless clients requirement, or you can select **Auto (Default)** to have the Router automatically adjust one the fastest and suitable data rate to fit network status at the time. Usually this function can be named Auto-Fallback feature. Auto-Fallback will treat one best connection rate between the Router and a wireless client. The default value is **Auto (Default)**.

Transmission Power: This option provides the Router's RFoutput power adjustment. To minimize the possibility of eavesdropping by unauthorized wireless users, suggest to decrease the transmission power with a needed by your wireless environment. By drop down menu, you can select the appropriate level, **Full (Default)**, **Half**, **Quarter**, **Eighth**, or **Min**. The default is **Full (Default)**.

CTS Protection Mode: CTS (Clear-To-Send) Protection Mode should be set to **Auto (Default)**. The Router will automatically use CTS Protection Mode when your Wireless-G products are experiencing severe problems and are not able to transmit to the Router in an environment with heavy 802.11b traffic. This function boosts the Router's ability to catch all Wireless-G transmissions but will severely decrease performance. If you do not want to use CTS Protection Mode at all, select **Disabled**.

Frame Burst Mode: This option can trigger your wireless network with higher performance. However, it should depend on the manufacturer of your wireless products, the default is **Enabled**.

Beacon Interval: The Beacon Interval value indicates the frequency interval of the beacon. Enter a value between 20 and 1000. A beacon is a packet broadcast by the Router to synchronize the wireless network. The default value is **100**.

DTIM Interval: This value indicates the interval of the Delivery Traffic Indication Message (DTIM). A DTIM field is a countdown field informing clients of the next window for listening to broadcast and multicast messages. When the Router has buffered broadcast or multicast messages for associated clients, it sends the next DTIM with a DTIM Interval value. Its clients hear the beacons and awaken to receive the broadcast and multicast messages. The default value is **1**.

Fragmentation Threshold: This value specifies the maximum size for a packet before data is fragmented into multiple packets. If you experience a high packet error rate, you may slightly increase the Fragmentation Threshold. Setting the Fragmentation Threshold too low may result in poor network performance. Only minor reduction of the default value is recommended. In most cases, it should remain at its default value of **2346**.

RTS Threshold: Using this setting can regulate your wireless network if you experience any inconsistent data flow situation, only by minor adjustment of the default value, the default value **2346** is recommended. The RTS/CTS mechanism will not be enabled if your wireless network packet less than RTS threshold value. The Router sends Request to Send (RTS) frames to a particular receiving station and negotiates the sending of a data frame. After receiving an RTS, the wireless station responds with a Clear to Send (CTS) frame to acknowledge the right to begin transmission. The RTS Threshold value should keep at its default value of **2346**.

The screenshot shows a configuration window for 'Wireless A+G' with a navigation bar at the top containing 'Setup', 'Wireless', 'Security', 'Access Restrictions', 'Applications & Gaming', 'Administration', and 'Status'. Below the navigation bar are sub-tabs: 'Basic Wireless Settings', 'Wireless Security', 'Wireless MAC Filter', and 'Advanced Wireless Settings'. The 'Advanced Wireless' section is active, containing two sub-sections: 'Wireless-A Settings' and 'Wireless-G Settings'. Each sub-section has a list of configuration parameters with dropdown menus and text input fields. At the bottom of the window are three buttons: 'Apply', 'Cancel', and 'Help'.

Section	Parameter	Value	Default	Range
Wireless-A Settings	Authentication Type	Open System	Open System	
	Transmission Rate	Auto	Auto	
	Transmission Power	Full	Full	
	Frame Burst Mode	Enabled	Enabled	
	Beacon Interval	100	100	20 ~ 1000
	DTIM Interval	1	1	1 ~ 16384
	Fragmentation Threshold	2346	2346	256 ~ 2346
	RTS Threshold	2346	2346	256 ~ 2346
Wireless-G Settings	Authentication Type	Open System	Open System	
	Basic Rate	Default	Default	
	Transmission Rate	Auto	Auto	
	Transmission Power	Full	Full	
	CTS Protection Mode	Auto	Auto	
	Frame Burst Mode	Enabled	Enabled	
	Beacon Interval	100	100	20 ~ 1000
	DTIM Interval	1	1	1 ~ 16384
Fragmentation Threshold	2346	2346	256 ~ 2346	
RTS Threshold	2347	2347	0 ~ 2347	

Change these settings as described here and click the **Apply** button to apply your changes or click **Cancel** to cancel your changes. For additional information, click **Help**.

4.9 Security

The section offers the Block Anonymous Internet Requests feature. You can enable this feature to secure your network.

Firewall

SPI Firewall Protection: Enable this feature to use Stateful Packet Inspection (SPI) for more detailed review of data packets entering your network environment.

Block Anonymous Requests: Enable this feature can restrict ICMP request such as “ping” command to probe your network from Internet users. It can hide your local network to enhance the security. This feature is enabled by default. Select **Disabled** to allow anonymous Internet requests.

Web Filters: Using the Web Filters feature, you may enable up to four specific filtering methods.

- ◆ **Proxy:** Use of WAN proxy servers may compromise the Router's security. Denying Proxy will disable access to any WAN proxy servers. To enable proxy filtering, click the Proxy box.
- ◆ **Java:** Java is a programming language for websites. If you deny Java, you run the risk of not having access to Internet sites created using this programming language. To enable Java filtering, click the Java box.
- ◆ **ActiveX:** ActiveX is a programming language for websites. If you deny ActiveX, you run the risk of not having access to Internet sites created using this programming language. To enable ActiveX filtering, click the ActiveX box.
- ◆ **Cookies:** A cookie is data stored on your PC and used by Internet sites when you interact with them. To enable cookie filtering, click the Cookies box.

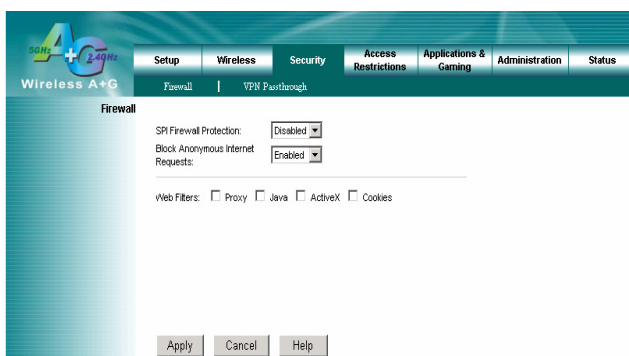

VPN Pass through

This Router provides VPN Pass through function for LAN client behind the Router to build VPN tunnels for secure the network. Use the settings on this tab to allow VPN tunnels using IPsec, L2TP, or PPTP protocols to pass through the Router's firewall.

IPsec Passthrough: Internet Protocol Security (IPsec) is a suite of protocols used to implement secure exchange of packets at the IP layer. IPsec Pass-Through is enabled by default. To disable IPsec Passthrough, select **Disabled**.

L2TP Passthrough: Layer 2 Tunneling Protocol is the method used to enable Point-to-Point sessions via the Internet on the Layer 2 level. L2TP Pass-Through is enabled by default. To disable L2TP Passthrough, select **Disabled**.

PPTP Passthrough: Point-to-Point Tunneling Protocol (PPTP) allows the Point-to-Point Protocol (PPP) to be tunneled through an IP network. PPTP Pass-Through is enabled by default. To disable PPTP Passthrough, select **Disabled**.

Change these settings as described here and click the **Apply** button to apply your changes or click **Cancel** to cancel your changes. For additional information, click **Help**.

4.10 Access Restrictions – Internet Access Policy

The Internet Access Policy screen allows you to block or allow specific kinds of Internet usage and traffic, such as Internet access, specified applications, websites, and incoming traffic during specific days and times.

Internet Access Policy

Access Policy: Use the settings on this screen to establish an access policy. Selecting a policy from the drop-down menu will display that policy's settings. To delete a policy, select that policy's number and click the **Delete This Policy** button. To view all the policies, click the **Summary** button.

On the Summary screen, the policies are listed with the following information: No., Policy Name, Access, Days, Time, and status (Enabled). You can change the type of access, days, and times of a policy. To activate a policy, click the **Enabled** checkbox. To delete a policy, click its **Delete** button. Click the **Save Settings** button to save your changes, or click the **Cancel Changes** button to cancel your changes. To return to the Internet Access Policy tab, click the **Close** button. To view the list of PCs for a specific policy, click the **Edit List** button.

On the Internet Access PCs list screen, you can select a PC by MAC Address or IP Address. You can also enter a range of IP Addresses if you want this policy to affect a group of PCs. After making your changes, click the **Save Settings** button to apply your changes or **Cancel Changes** to cancel your changes. Click the **Close** button to exit this screen.

Internet Access policy creation procedure

1. Select a number from the *Access Policy* drop-down menu.
2. Enter a Policy Name in the field provided.
3. Select **Enabled** from the Status drop-down menu.
4. Click the **Edit List** button to select which PCs will be applied by the policy. The PCs List screen will appear. You can select a PC by MAC Address or IP Address. You can also enter a range of IP Addresses if you want this policy to affect a group of PCs. After making your changes, click the **Save Settings** button to apply your changes or **Cancel Changes** to cancel your changes. Then click the **Close** button.
5. Select **Deny** or **Allow** option from Access restriction which depending on whether you want to block or allow Internet access for the PCs you listed on the PCs List table screen.
6. Define the schedule of days and times what you want this policy to be enforced. Select the days during which the policy will be taken effect, or select **Everyday**. Enter a range of hours and minutes during which the policy will be taken effect, or select **24 Hours**.
7. Select what kind of service that will be filtered by drop-down menus next to Blocked Application Port. Each drop-down menu offers a choice of application service. Each preset applications that you selected will show the appropriate port range automatically. If the application you want to filter is not listed or you want to customize the settings, then select **Custom** from the drop-down menu. Enter the port range you want to filter. Then select its protocol(s), **TCP** and/or **UDP**.
8. If you want to block websites with specific URL addresses, enter each URL address in a Website Blocking by URL Address field. You can enter up to four URL addresses.
9. If you want to block websites that use specific keywords as part of their URL addresses, enter each keyword in a Website Blocking by Keyword field.

Note1: The policy of above step 1 ~ step 6 is only valid when the certain Days/Times is within the Schedule. If the certain Days/Times are not within the schedule, it will allow all hosts to access Internet. That means beyond the policy control, the router will not restrict the access.

Note2: The policy of above step 7 ~ step 9 will BLOCK all hosts, not only PCs in the list.

4.11 Application & Gaming – Port Range Forwarding

The Port Range Forwarding screen allows you to offer public services from your local network, such as web servers, ftp servers, e-mail servers. Before using forwarding feature, the servers that will provide Internet services should assign one static IP address.

Port Range Forwarding

To forward a service from local network, please fill in the relevant information on each field.

Application Name: Each drop-down menu offers a choice of preset applications (select **None** if you do not want to use any of the preset applications). Select up to five preset applications. For custom applications, enter the name of your application in one of the available fields.

The preset applications are among the most generally used Internet applications. They include the following:

FTP (File Transfer Protocol): A protocol used to transfer files over a TCP/IP network.

Telnet: Telnet offers a way to remotely log on to a network device and work on it. By logging on to this device remotely, users can access services or resources that they may not have on their own workstation.

SMTP (Simple Mail Transfer Protocol): The standard e-mail protocol on the Internet. It is a TCP/IP protocol that defines the message format and the Message Transfer Agent (MTA), which stores and forwards the mail.

DNS (Domain Name System): DNS is a method for naming computers and network services. TCP/IP networks use the DNS naming convention to locate computers and services through user-friendly domain names. When a user enters a domain name in an application, the DNS service maps the name to an IP address.

TFTP (Trivial File Transfer Protocol): It's one protocol to use UDP for small files transmission between 2 network devices.

Finger: A UNIX command widely used on the Internet to find out information about a particular user, such as a telephone number, whether the user is currently logged on, and the last time the user was logged on. The person being "fingered" must have placed his or her profile on the system in order for the information to be available. Fingering requires entering the full user@domain address.

HTTP (HyperText Transport Protocol): HTTP is a convention for sending messages from a server to a client by using TCP/IP.

POP3 (Post Office Protocol 3): A standard mail server commonly used on the Internet. It provides a message store that holds incoming e-mail until users log on and download it.

NNTP (Network News Transfer Protocol): NNTP is a protocol that enables you to post, distribute, and retrieve messages on Internet and intranet newsgroups.

SNMP (Simple Network Management Protocol): SNMP is one protocol that allows you to customize the SNMP settings. SNMP is a popular network monitoring and management protocol.

Start/End: This is the port range. Enter the range of port number that used by the designated computer or Internet application.

Protocol: Select the protocol that used for this application, **TCP** and/or **UDP**.

To IP Address: For each application, enter the IP address of the computer running the specific application.

Enabled: Click the **Enabled** checkbox to enable port forwarding for the relevant application.

Apply Cancel Help

Change these settings as described here and click the **Apply** button to apply your changes or click **Cancel** to cancel your changes. For additional information, click **Help**.

4.12 Application & Gaming – Port Range Triggering

The Port Range Triggering is used for special Internet applications whose outgoing ports differ from the incoming ports. For this feature, the Router will watch outgoing data for specific port numbers. The Router will remember the IP address of the computer that sends a transmission requesting data, so that when the requested data returns through the Router, the data is pulled back to the proper computer by way of IP address and port mapping rules.

Port Range Triggering

Application Name: Enter the application name of the trigger.

Triggered Range: For each application, list the triggered port number range. Check with the Internet application documentation for the port number(s) needed. In the first field, enter the starting port number of the Triggered Range. In the second field, enter the ending port number of the Triggered Range.

Forwarded Range: For each application, list the forwarded port number range. Check with the Internet application documentation for the port number(s) needed. In the first field, enter the starting port number of the Forwarded Range. In the second field, enter the ending port number of the Forwarded Range.

Enabled: Click the **Enabled** checkbox to enable port range triggering for the relevant application.

Change these settings as described here and click the **Apply** button to apply your changes or click **Cancel** to cancel your changes. For additional information, click **Help**.

4.13 Application & Gaming – DMZ

The DMZ (De-Militarized Zone) feature allows a computer or small sub-network that locates between a trusted internal network and an un-trusted external network, such as the Internet. Typically, the DMZ contains devices accessible to Internet traffic, such as Web (HTTP) servers, FTP servers, SMTP (e-mail) servers and DNS servers. Any computer whose port is being forwarded from DMZ must have its DHCP client function disabled and should have a static IP address assigned to it because its IP address may change when using the DHCP function.

DMZ

To expose one PC, select **Enabled**.

Internet Source IP Address: If you want to allow any Internet IP address to access the exposed computer, select **Any IP Address**. If you want to allow a specific IP address or range of IP addresses to access the exposed computer, select the second option and enter the IP address or range of IP addresses in the fields provided.

Destination Host IP Address: Enter the IP address of the computer you want to expose.

The screenshot shows the DMZ configuration page in a router's web interface. The interface has a teal header with the 'Wireless A+G' logo and navigation tabs for Setup, Wireless, Security, Access Restrictions, Applications & Gaming, Administration, and Status. Under the Applications & Gaming tab, there are sub-tabs for Port Range Forwarding, Port Range Triggering, DMZ, and QoS. The DMZ sub-tab is active, showing a 'DMZ' section with a 'Disabled' dropdown menu. Below this, there are two radio button options: 'Any IP Address' (selected) and a specific IP address range option. The 'Source IP Address' field is currently empty. The 'Host IP Address' field is filled with '192.168.1.0'. At the bottom of the form are three buttons: 'Apply', 'Cancel', and 'Help'.

Change these settings as described here and click the **Apply** button to apply your changes or click **Cancel** to cancel your changes. For additional information, click **Help**.

4.14 Application & Gaming –QoS

QoS (Quality of Service) is a set of service requirements that the network must meet to ensure an adequate service level for data transmission. Using QoS, you can control how network bandwidth is allocated to applications. QoS provides a guaranteed, end-to-end, express delivery system for information across the network.

QoS (Quality of Service)

There are three types of QoS available, Application Port Priority, MAC Address Priority, and LAN Port Priority.

Application Port Priority

Depending on the settings of the QoS screen, this feature will assign information a specific priority for up to five preset applications and up to five additional applications that you specify.

Application Name: Each drop-down menu offers a choice of preset applications (select **None** if you do not want to use any of the preset applications). Select up to five preset applications. For custom applications, enter the name of your application in one of the available fields.

Priority: Select one of these priority levels: **Normal, Above Normal, High, Highest.**

Port: For preset applications, the port number is automatically displayed. For custom applications, enter the appropriate port number in the Port field.

Enabled: Click the **Enabled** checkbox to enable QoS for the relevant application.

Application Name	Priority	Port	Enabled
None	Normal	0	<input type="checkbox"/>
None	Normal	0	<input type="checkbox"/>
None	Normal	0	<input type="checkbox"/>
None	Normal	0	<input type="checkbox"/>
None	Normal	0	<input type="checkbox"/>
	Normal	0	<input type="checkbox"/>
	Normal	0	<input type="checkbox"/>
	Normal	0	<input type="checkbox"/>
	Normal	0	<input type="checkbox"/>
	Normal	0	<input type="checkbox"/>

MAC Address Priority

Depending on the settings of the QoS screen, this feature will assign a specific priority for up to five network devices.

Client Device Name: Enter the name of your network device.

Priority: Select one of these priority levels: **Normal, Above Normal, High, Highest.**

MAC: Enter the MAC address of the device.

Enabled: Click the **Enabled** checkbox to enable QoS for the appropriate MAC address.

Client Device Name	Priority	MAC	Enabled
	Normal	00:00:00:00:00:00	<input type="checkbox"/>
	Normal	00:00:00:00:00:00	<input type="checkbox"/>
	Normal	00:00:00:00:00:00	<input type="checkbox"/>
	Normal	00:00:00:00:00:00	<input type="checkbox"/>
	Normal	00:00:00:00:00:00	<input type="checkbox"/>

LAN Port Priority

QoS allows you to prioritize performance for the Router's LAN Ports (1-4). It does not require support from your ISP because the prioritized ports are LAN ports going out to your network.

Port Number: The Router's LAN port numbers are automatically displayed here.

Flow Control: For each port, if you want the Router to control the transmission of data between network devices, select **Enabled**. To disable this feature, select **Disabled**.

Speed: This setting limits the speed possible for each port. To use this feature, select **50M**, **20M**, **10M**, **5M**, **2M**, **1M**, **512k**, or **256k** (M stands for Mbps, while k stands for kbps). If you do not want to use this feature, keep the default, **Unlimited**.

Enabled: Click the **Enabled** checkbox to enable QoS for the appropriate LAN port.

Port Number	Flow Control	Speed	Enabled
1	Disabled	Unlimited	<input type="checkbox"/>
2	Disabled	Unlimited	<input type="checkbox"/>
3	Disabled	Unlimited	<input type="checkbox"/>
4	Disabled	Unlimited	<input type="checkbox"/>

Change these settings as described here and click the **Apply** button to apply your changes or click **Cancel** to cancel your changes. For additional information, click **Help**.

4.15 Administration – Management

This section allows the network's administrator to manage specific Router functions for access and security.

Management

Router Password

Router Password and Re-enter to Confirm: You can change the Router's password from here. Enter a new Router password and then type it again in the Re-enter to Confirm field to confirm.

Remote Router Access

Remote Management: To access the Router remotely, from outside of local network, select **Enabled**. Otherwise, keep the default setting, **Disabled**.

Remote Upgrade: If you want to be able to upgrade the Router remotely, from outside of local network, select **Enabled**. (You must have the Remote Management feature enabled as well.) Otherwise, keep the default setting, **Disabled**.

Allow Remote IP Address: If you want to be able to access the Router from outside with any external IP address, select **Any IP Address**. If you want to specify an external IP address or range of IP addresses, then select the second option and complete the fields provided.

Remote Management Port: Enter the port number that will be open to outside access.

UPnP

Universal Plug and Play (UPnP) is a distributed, open networking architecture that leverages TCP/IP and the Web technologies to enable seamless proximity networking in addition to control and data transfer among networked devices in the home, office, and public spaces.

UPnP: If you want to use UPnP, keep the default setting, **Enabled**. Otherwise, select **Disabled**.

Allow Users to Configure: Keep the default setting, **Enabled**, if you want to be able to make manual changes to the Router while using the UPnP feature. Otherwise, select **Disabled**.

Allow Users to Disable Internet Access: Keep the default setting, **Enabled**, if you want to be able to forbid any and all Internet connections. Otherwise, select **Disabled**.

Backup and Restore

Backup Settings: To back up the Router's configuration, click this button and follow the on-screen instructions.

Restore Settings: To restore the Router's configuration, click this button and follow the on-screen instructions. (You must have previously backed up the Router's configuration.)

The screenshot shows the 'Administration' page of a router, specifically the 'Management' sub-section. The navigation bar includes 'Setup', 'Wireless', 'Security', 'Access Restrictions', 'Applications & Gaming', 'Administration', and 'Status'. Under 'Administration', there are sub-tabs for 'Management', 'Log', 'Diagnostics', 'Factory Defaults', and 'Firmware Upgrade'. The 'Management' section is active and contains the following settings:

- Router Password:** Two text boxes for 'Router Password' and 'Re-enter to Confirm', both containing six asterisks.
- Remote Router Access:**
 - 'Remote Management': Enabled (dropdown menu)
 - 'Remote Upgrade': Enabled (dropdown menu)
 - 'Allow Remote IP Address': Any IP Address (radio button selected)
 - 'Remote Management Port': 8080 (text box)
- UPnP:**
 - 'UPnP': Enabled (dropdown menu)
 - 'Allow Users to Configure': Enabled (dropdown menu)
 - 'Allow Users to Disable Internet Access': Enabled (dropdown menu)
- Backup and Restore:** Two buttons: 'Backup Settings' and 'Restore Settings'.

At the bottom of the page are three buttons: 'Apply', 'Cancel', and 'Help'.

Change these settings as described here and click the **Apply** button to apply your changes or click **Cancel** to cancel your changes. For additional information, click **Help**.

4.16 Administration – Log

The Router can keep logs of all traffic for your Internet connection. This feature is disabled by default. To keep activity logs, select **Enable**.

Log

To disable the Log function, keep the default setting, **Disabled**. To monitor traffic between the network and the Internet, select **Enabled**.

Logviewer IP Address: For a permanent record of the Router's activity logs, Logviewer software must be used. This software can be gotten from CD. The Log viewer saves all incoming and outgoing activity in a permanent file on your PC's hard drive. In the Logviewer IP Address field, enter the fixed IP address of the PC running the Log viewer software. The Router will now send updated logs to that PC.

View Log: When you wish to view the logs, click **View Log**. A new screen will appear. Select **Incoming Log** or **Outgoing Log** from the Type drop-down menu. The Incoming Log will display a temporary log of the Source IP Addresses and Destination Port Numbers for the incoming Internet traffic. Click the **Save the Log** button to save this information to a file on your PC's hard drive. Click the **Refresh** button to update the log. Click the **Clear** button to clear all the information that is displayed.

The Outgoing Log will display a temporary log of the LAN IP Addresses, Destination URLs or IP Addresses, and Service or Port Numbers for the outgoing Internet traffic. Click the **Save the Log** button to save this information to a file on your PC's hard drive. Click the **Refresh** button to update the log. Click the **Clear** button to clear all the information that is displayed.

Change these settings as described here and click the **Apply** button to apply your changes or click **Cancel** to cancel your changes. For additional information, click **Help**.

4.17 Administration – Diagnostics

The diagnostics function provides two ways for Router's status of Internet connection.

Diagnostics

Ping Test

This utility verifies configurations and tests IP connectivity between two computers. Ping sends an ICMP request from the source computer, and the destination computer responds with an ICMP reply.

To IP or URL Address: Enter the IP address or URL that you want to ping.

Packet Size: Enter the size of the packet you want to use.

Times to Ping: Select the number of times you wish to ping: **5**, **10**, **15**, or **Unlimited**.

Start to Ping: Click this button to begin the test. A new screen will appear and display the test results. Click the **Close** button to return to the *Diagnostics* screen.

Traceroute Test

Traceroute function provides a trace for the route that a packet takes to destination.

To IP or URL Address: Enter the destination IP address or URL that you want to trace the routes.

Start to Tracert: Click this button to begin the Tracert. A new screen will appear and display the trace results. Click the

Close button to return to the *Diagnostics* screen.

The screenshot shows the router's web interface. At the top, there is a navigation menu with tabs for Setup, Wireless, Security, Access Restrictions, Applications & Gaming, Administration, and Status. Below the menu, the 'Diagnostics' section is active. It contains two main sections: 'Ping Test' and 'Traceroute Test'. The 'Ping Test' section has three input fields: 'To IP or URL Address:' (empty), 'Packet Size:' (32 bytes (32~65500)), and 'Times to Ping:' (5). Below these fields is a 'Start to Ping' button. The 'Traceroute Test' section has one input field: 'To IP or URL Address:' (empty), with a 'Start to Tracert' button below it.

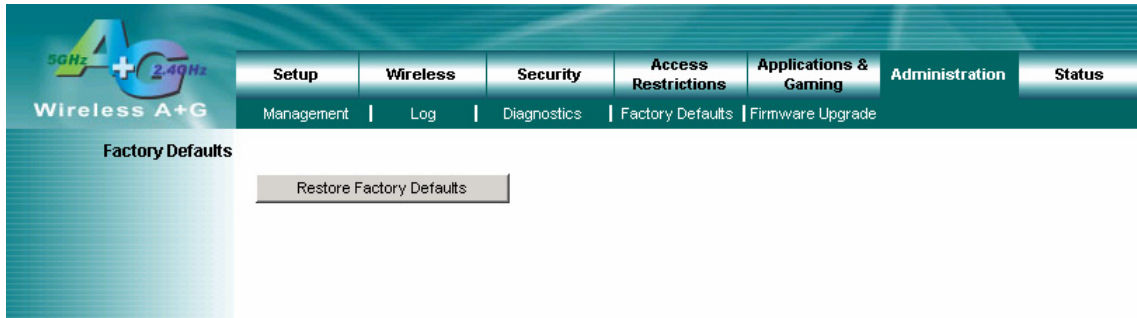

Change these settings as described here and click the **Apply** button to apply your changes or click **Cancel** to cancel your changes. For additional information, click **Help**.

4.18 Administration – Factory Defaults

This Factory Defaults allows you to restore the Router's configuration to its factory default settings.

Factory Defaults

Restore Factory Defaults: Click this button to reset all configuration settings to their default values. Any settings you have saved will be lost when the default settings are restored.

4.19 Administration – Firmware Upgrade

This Firmware Upgrade screen allows you to upgrade the Router's firmware. Do not upgrade the firmware unless you are experiencing problems with the Router or the new firmware has a feature you want to use.

Firmware Upgrade

Please select a file to upgrade: In the field provided, enter the name of the extracted firmware upgrade file, or click the **Browse** button to find this file.

Start to Upgrade: After you have selected the appropriate file, click this button for upgrade.

The screenshot shows the 'Firmware Upgrade' page in a router's web interface. At the top, there is a navigation menu with tabs for 'Setup', 'Wireless', 'Security', 'Access Restrictions', 'Applications & Gaming', 'Administration', and 'Status'. The 'Administration' tab is selected, and a sub-menu below it includes 'Management', 'Log', 'Diagnostics', 'Factory Defaults', and 'Firmware Upgrade'. The main content area is titled 'Firmware Upgrade' and features a 'Please Select a File to Upgrade:' label, a text input field, and a '浏览...' (Browse) button. Below the input field is a 'Start to Upgrade' button. A red warning message states: 'Warning: Upgrading firmware may take a few minutes, please don't turn off the power or press the reset button.' At the bottom, there is a progress bar showing 0% completion and a red warning: 'Upgrade must NOT be interrupted !!'.

4.20 Status – Router

The Router screen on the Status Tab displays information about the Router and its current settings. The Internet Connection information will vary depending on the Internet Connection Type you use.

Router Information

Firmware Version: This is the Router's current firmware.

Current Time: This shows the time by the time zone you selected on the Setup Tab.

Internet MAC Address: This is the Router's MAC Address.

Host Name: If required by your ISP, it would be entered on the Setup Tab.

Domain Name: If required by your ISP, it would be entered on the Setup Tab.

Internet Connection

Connection Type: This indicates the current Internet connection type you are using.

Connection Status: The status of the connection is displayed only for a PPPoE connection type. For this dial-up style connection, click the **Connect** button, if there is no connection to establish. When your PPPoE connection is active, you can click the **Disconnect** button to end the connection.

IP Address: The Router's Internet IP Address.

Subnet Mask and Default Gateway: The Router's Subnet Mask and Default Gateway address are displayed here.

DNS1-3: The DNS (Domain Name System) IP addresses currently is used by the Router. The Router at least one DNS IP should be used for domain name resolution.

IP Release: This button is for DHCP connection type, click this button to release the current Internet IP address.

IP Renew: This button is for DHCP connection type, click this button to renew the current Internet IP address.

Click the **Refresh** button to update the on-screen information.

The screenshot shows the 'Status' tab of a router's web interface. The top navigation bar includes 'Setup', 'Wireless', 'Security', 'Access Restrictions', 'Applications & Gaming', 'Administration', and 'Status'. Below the navigation bar, the 'Router Information' section displays: Firmware Version: 1.02, Mar 08, 2005; Current Time: MON DEC 24 03:07:57 2001; Internet MAC Address: 00:12:17:9f:5c:d8; Host Name: (empty); Domain Name: (empty). The 'Internet Connection' section displays: Connection Type: Automatic Configuration - DHCP; IP Address: 210.66.97.127; Subnet Mask: 255.255.255.0; Default Gateway: 210.66.97.17; DNS1: 168.95.1.1; DNS2: 0.0.0.0; DNS3: 0.0.0.0. At the bottom of the Internet Connection section are buttons for 'IP Release', 'IP Renew', and 'Refresh'.

4.21 Status – Local Network

The Local Network screen on the Status Tab displays the status of your network.

Local Network

Local MAC Address: This is the Router's local MAC Address.

Router IP Address: This is the Router's local IP Address.

Subnet Mask: This is the Router's local subnet mask.

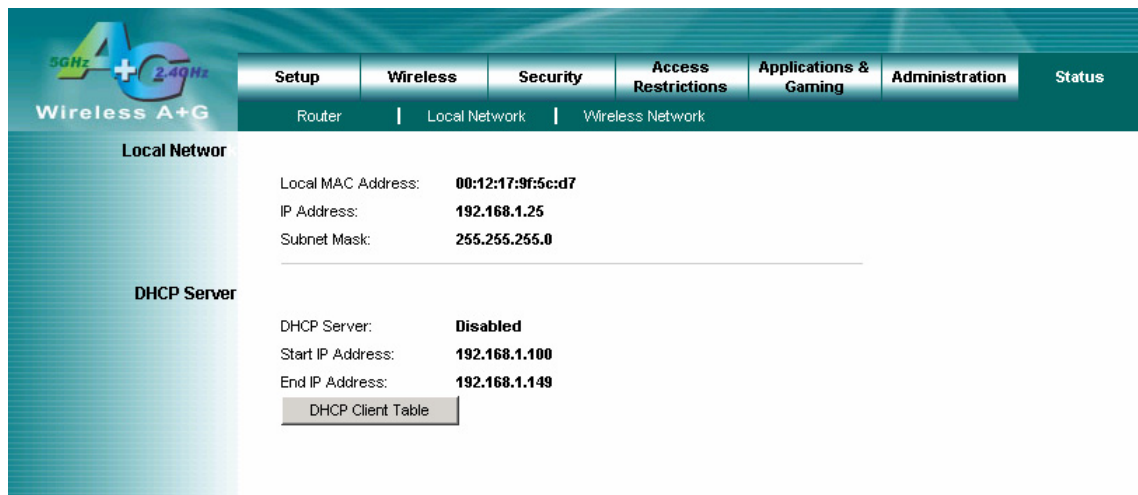

DHCP Server

DHCP Server: The Router's embedded DHCP server status.

Start IP Address: This is beginning range of assigned IP by Router's DHCP server.

End IP Address: This is end range of assigned IP by Router's DHCP server.

DHCP Client Table: Clicking this button will open a screen to show which hosts are using the Router as a DHCP server. On the DHCP Client Table screen, you will see a list of DHCP clients with the following information: Client Names, Interfaces, IP Addresses, MAC Addresses, and the assigned IP addresses expired time. From the To Sort by drop-down menu, you can sort the table by Client Name, Interface, IP Address, or MAC Address. To remove a DHCP client from this list, click its **Delete** button. To view the most up-to-date information, click the **Refresh** button. To exit this screen, click the **Close** button.

4.22 Status – Wireless Network

The Wireless Network screen on the Status Tab displays the information of your Wireless networks.

Wireless Network

Wireless-A

MAC Address: This is the Router's Wireless-A band MAC Address.

Mode: This mode is displaying the current status of Wireless-A band network. **Enabled** means the A band network is ON.

Turbo Mode: This mode is displaying the turbo mode status. (**Enabled/Disbaled**)

Network Name (SSID): The Wireless-A band network name.

Channel: The current A band channel you are using.

Security: This displays what type of encryption you are using.

SSID Broadcast: This displays the Router's SSID Broadcast status.

Wireless-G

MAC Address: This is the Router's Wireless-G band MAC Address.

Mode: This displays the Wireless-G band network mode.

Network Name (SSID): The Wireless-G band network name.

Channel: The current G band channel you are using.

Security: This displays what type of encryption you are using.

SSID Broadcast: This displays the Router's SSID Broadcast status.

The screenshot shows a router's web interface with a navigation menu at the top: Setup, Wireless, Security, Access Restrictions, Applications & Gaming, Administration, and Status. The 'Wireless' menu is selected, and the 'Wireless Network' sub-menu is active. The main content area is titled 'Wireless Network' and contains two sections: 'Wireless-A Information' and 'Wireless-G Information'. Each section lists various network parameters and their current status.

Section	Parameter	Value
Wireless-A Information	MAC Address:	00:12:17:9f:5c:d5
	Mode:	Enabled
	Turbo Mode:	Disabled
	Network Name (SSID):	wlan-a
	Channel:	Auto (DFS)
	Security:	Disabled
	SSID Broadcast:	Enabled
Wireless-G Information	MAC Address:	00:12:17:9f:5c:d6
	Mode:	Mixed
	Network Name (SSID):	wlan-g
	Channel:	6 - 2.437GHz
	Security:	Disabled
	SSID Broadcast:	Enabled

5. Troubleshooting – Q & A

1. I'm trying to log on the Router's Web configuration page, but I do not see the login screen.

Answer:

1. Please make sure the IP address that you input on address field of IE browser is correct.
2. Make sure the physical layer connection is established. If you are using wired to connect this Router, check the relevant LAN LED whether is lit or not.
3. On Dos Prompt screen, using "ping" command to probe this Router, check if you got reply from it.
Command: ping < Destination IP address >
4. If you have any TCP/IP setting problem, please refer to the Quick Installation Guide.

2. I need to set up a server behind my Router and make it available to the public.

Answer:

This is Router's forwarding function. Please refer to the section 4.12. Generally, using a server like a web, ftp, or mail server, you need to know what kinds of the respective port numbers they are using.

For example, port 80 (HTTP) is used for web; port 21 (FTP) is used for FTP, and port 25 (SMTP outgoing) and port 110 (POP3 incoming).

Below is an example for how to set up a FTP server behind Router for public network access.

1. Log on the Router's web configuration page, <http://192.168.1.1> or the IP address that you have changed.
2. Select the Applications & Gaming => Port Range Forwarding tab.
3. Enter any name you want to use like "FTP service".
4. Enter the External Port range of the FTP service you are using. For example, your FTP service port range should be port 20 ~ 21.
5. Select the protocol, TCP and UDP.
6. Enter the IP address of the FTP server that locate on your local network. For example, if your FTP server's IP address is 192.168.1.10, then you should enter 10 in the address field.
7. Click the **Enabled** option for enable this service.

3. I forgot my password, how to log on this Router for configuration?

Answer:

1. Reset the Router to factory default by pressing the Reset button for 10 seconds then releasing it.
2. Log on the Router's web management by <http://192.168.1.1>
Leave username blank and enter the default password **admin**.

4. How to set the Router to factory default setting.

Answer:

1. Reset the Router to factory default by pressing the Reset button for 10 seconds then releasing it.
2. After release the Reset button, the Router will get back all setting to factory default and reboot system.
3. While the reboot is complete, log on the Router's web management by default IP <http://192.168.1.1>
Leave username blank and enter the default password **admin**.

5. My SOHO AP will not turn on. No LED's light up.

Answer:

Usually it is caused by the power is not connected.

Please double check the power adapter if it connected to your Router and the other side is plugged into the power outlet.

6. I can't access the AP from a wireless client.

Answer:

Generally to make the wireless client unable to access AP with following possible issues:

1. Settings are not the same among each wireless adapter.

2. Out of range.
3. IP Address is not set correctly.

Resolution:

Make sure that the mode, SSID, Channel and encryption settings are set the same on each wireless adapter. Make sure that your computer is within range and free from any strong electrical devices that may cause interference.

7. What devices cause interference?

Answer:

The Router is operating in the unlicensed 2.4 GHz band. Other devices operates in this frequency range that may cause interference include microwave ovens and 2.4 GHz portable phones. PCs or analog cellular phones do not operate at 2.4 GHz and do not cause interference. Proper placement of access points usually eliminates interference problems created by other 2.4 GHz devices.

Limited Warranty

TRENDware warrants its products against defects in material and workmanship, under normal use and service, for the following lengths of time from the date of purchase.

Wireless Products – 3 Years Warranty

If a product does not operate as warranted above during the applicable warranty period, TRENDware shall, at its option and expense, repair the defective product or part, deliver to customer an equivalent product or part to replace the defective item, or refund to customer the purchase price paid for the defective product. All products that are replaced will become the property of TRENDware. Replacement products may be new or reconditioned.

TRENDware shall not be responsible for any software, firmware, information, or memory data of customer contained in, stored on, or integrated with any products returned to TRENDware pursuant to any warranty.

There are no user serviceable parts inside the product. Do not remove or attempt to service the product by any unauthorized service center. This warranty is voided if (i) the product has been modified or repaired by any unauthorized service center, (ii) the product was subject to accident, abuse, or improper use (iii) the product was subject to conditions more severe than those specified in the manual.

Warranty service may be obtained by contacting TRENDware office within the applicable warranty period for a Return Material Authorization (RMA) number, accompanied by a copy of the dated proof of the purchase. Products returned to TRENDware must be pre-authorized by TRENDware with RMA number marked on the outside of the package, and sent prepaid, insured and packaged appropriately for safe shipment.

WARRANTIES EXCLUSIVE: IF THE TRENDWARE PRODUCT DOES NOT OPERATE AS WARRANTED ABOVE, THE CUSTOMER'S SOLE REMEDY SHALL BE, AT TRENDWARE'S OPTION, REPAIR OR REPLACEMENT. THE FOREGOING WARRANTIES AND REMEDIES ARE EXCLUSIVE AND ARE IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, EITHER IN FACT OR BY OPERATION OF LAW, STATUTORY OR OTHERWISE, INCLUDING WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. TRENDWARE NEITHER ASSUMES NOR AUTHORIZES ANY OTHER PERSON TO ASSUME FOR IT ANY OTHER LIABILITY IN CONNECTION WITH THE SALE, INSTALLATION MAINTENANCE OR USE OF TRENDWARE'S PRODUCTS.

TRENDWARE SHALL NOT BE LIABLE UNDER THIS WARRANTY IF ITS TESTING AND EXAMINATION DISCLOSE THAT THE ALLEGED DEFECT IN THE PRODUCT DOES NOT EXIST OR WAS CAUSED BY CUSTOMER'S OR ANY THIRD PERSON'S MISUSE, NEGLIGENCE, IMPROPER INSTALLATION OR TESTING, UNAUTHORIZED ATTEMPTS TO REPAIR OR MODIFY, OR ANY OTHER CAUSE BEYOND THE RANGE OF THE INTENDED USE, OR BY ACCIDENT, FIRE, LIGHTNING, OR OTHER HAZARD.

LIMITATION OF LIABILITY: TO THE FULL EXTENT ALLOWED BY LAW TRENDWARE ALSO EXCLUDES FOR ITSELF AND ITS SUPPLIERS ANY LIABILITY, WHETHER BASED IN CONTRACT OR TORT (INCLUDING NEGLIGENCE), FOR INCIDENTAL, CONSEQUENTIAL, INDIRECT, SPECIAL, OR PUNITIVE DAMAGES OF ANY KIND, OR FOR LOSS OF REVENUE OR PROFITS, LOSS OF BUSINESS, LOSS OF INFORMATION OR DATA, OR OTHER FINANCIAL LOSS ARISING OUT OF OR IN CONNECTION WITH THE SALE, INSTALLATION, MAINTENANCE, USE, PERFORMANCE, FAILURE, OR INTERRUPTION OF THE POSSIBILITY OF SUCH DAMAGES, AND LIMITS ITS LIABILITY TO REPAIR, REPLACEMENT, OR REFUND OF THE PURCHASE PRICE PAID, AT TRENDWARE'S OPTION. THIS DISCLAIMER OF LIABILITY FOR DAMAGES WILL NOT BE AFFECTED IF ANY REMEDY PROVIDED HEREIN SHALL FAIL OF ITS ESSENTIAL PURPOSE.

Governing Law: This Limited Warranty shall be governed by the laws of the state of California.

AC/DC Power Adapter, Cooling Fan, and Power Supply carry

1 Year Warranty

Federal Communication Commission Interference Statement

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

FCC Caution: Any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate this equipment.

IMPORTANT NOTE:

FCC Radiation Exposure Statement:

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20cm between the radiator & your body.

If this device is going to be operated in 5.15 ~ 5.25GHz frequency range, then it is restricted in indoor environment only.

This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

TRENDware declares that TEW-511BRP (FCC ID: RYK-WL7615A) is limited in CH1~CH11 for 2.4 GHz by specified firmware controlled in U.S.A.
