User's Guide

**TEW-633GR**

## Federal Communication Commission Interference Statement

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

FCC Caution: Any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate this equipment.

### **IMPORTANT NOTE:**

#### **FCC Radiation Exposure Statement:**

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20cm between the radiator & your body.

This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

TRENDnet declares that TEW-633GR (FCC ID: S9ZTEW633GR) is limited in CH1~CH11 for 2.4 GHz by specified firmware controlled in U.S.A.

# **Getting Started with the TEW-633GR**

Congratulations on purchasing the TEW-633GR! This manual provides information for setting up and configuring the TEW-633GR. This manual is intended for both home users and professionals.

The following conventions are used in this manual:

**THE NOTE SYMBOL INDICATES ADDITIONAL INFORMATION ON THE TOPIC AT HAND.**

**THE TIP SYMBOL INDICATES HELPFUL INFORMATION AND TIPS TO IMPROVE YOUR NETWORK EXPERIENCE.**

**THE CAUTION SYMBOL ALERTS YOU TO SITUATIONS THAT MAY DEGRADE YOUR NETWORKING EXPERIENCE OR COMPROMISE**

**LIKE NOTES AND TIPS, THE IMPORTANT SYMBOL INDICATES INFORMATION THAT CAN IMPROVE NETWORKING. THIS INFORMATION SHOULD NOT BE OVERLOOKED.**

## Package Contents

- TEW-633GR 11n Wireless N Gigabit Router
- CAT-5 Ethernet Cable
- Power Adapter
- User's Guide CD-ROM
- Multi-Language Quick Installation Guide

Using a power supply with a different voltage than the one included with your product will cause damage and void the warranty for this product.

## Minimum System Requirements

- Ethernet-Based Cable or DSL Modem
- Computers with Windows, Macintosh, or Linux-based operating systems with an installed Ethernet adapter and CD-ROM Drive
- Internet Explorer Version 6.0 or Netscape Navigator Version 7.0 and Above

# Wireless LAN Networking

This section provides background information on wireless LAN networking technology. Consult the **Glossary** for definitions of the terminology used in this section.

THE INFORMATION IN THIS SECTION IS FOR YOUR REFERENCE. CHANGING NETWORK SETTINGS AND PARTICULARLY SECURITY SETTINGS SHOULD ONLY BE DONE BY AN AUTHORIZED ADMINISTRATOR.

## Transmission Rate (Transfer Rate)

---

The TEW-633GR provides various transmission (data) rate options for you to select. In most networking scenarios, the factory default Best (automatic) setting proves the most efficient. This setting allows your TEW-633GR to operate at the maximum transmission (data) rate. When the communication quality drops below a certain level, the TEW-633GR automatically switches to a lower transmission (data) rate. Transmission at lower data speeds is usually more reliable. However, when the communication quality improves again, the TEW-633GR gradually increases the transmission (data) rate again until it reaches the highest available transmission rate.

## Types of Wireless Networks

---

Wireless LAN networking works in either of the two modes: ad-hoc and infrastructure. In infrastructure mode, wireless devices communicate to a wired LAN via access points. Each access point and its wireless devices are known as a Basic Service Set (BSS). An Extended Service Set (ESS) is two or more BSSs in the same subnet. In ad hoc mode (also known as peer-to-peer mode), wireless devices communicate with each other directly and do not use an access point. This is an Independent BSS (IBSS).

To connect to a wired network within a coverage area using access points, set the operation mode to Infrastructure (BSS). To set up an independent wireless workgroup without an access point, use Ad-hoc (IBSS) mode.

### **Ad-Hoc (IBSS) NETWORK**

Ad-hoc mode does not require an access point or a wired network. Two or more wireless stations communicate directly to each other. An ad-hoc network may sometimes be referred to as an Independent Basic Service Set (IBSS).

To set up an ad-hoc network, configure all the stations in ad-hoc mode. Use the same SSID and channel for each station.

Ad-hoc (also known as peer-to-peer) network diagram

When a number of wireless stations are connected using a single access point, you have a Basic Service Set (BSS).

Infrastructure (IBSS) network diagram

In the ESS diagram below, communication is done through the access points, which relay data packets to other wireless stations or devices connected to the wired network. Wireless stations can then access resources, such as a printer, on the wired network.

Infrastructure (ESS) network diagram

In an ESS environment, users are able to move from one access point to another without losing the connection. In the diagram below, when the user moves from BSS (1) to BSS (2) the WLAN client devices automatically switches to the channel used in BSS (2).

Roaming in an ESS network diagram

# **Introduction**

The TEW-633GR 11n Wireless Gigabit Router is a high-performance, wireless router that supports high-speed wireless networking at home, at work or in public places.

Unlike most routers, the TEW-633GR provides data transfers at up to 300Mbps when using 11n (Draft 2.0) connection. This router is also back compatible with 802.11g or 11b devices. This means that you do not need to change your entire network to maintain connectivity. You may sacrifice some of 11n's speed when you mix 11n and 11b/g devices, but you will not lose the ability to communicate when you incorporate the 11n (Draft 2.0) standard into your 11b/g network. You may choose to slowly change your network by gradually replacing the 11b/g devices with 11n devices.

## **Features**

- Wi-Fi Compliant with IEEE 802.11n (Draft 2.0) and IEEE 802.11b/g Standards
- 2.412 to 2.484GHz frequency band operation
- Compliant with IEEE 802.3 & 3u standards
- Support 4 10/100/1000Mbps Gigabit LAN ports and 1 10/100/1000Mbps Gigabit WAN port
- High-Speed up to 300Mbps Data Rate using IEEE 802.11n (Draft 2.0) connection
- Supports Cable/DSL Modems with Dynamic IP, Static IP, PPPoE, PPTP, L2TP or BigPond Connection Types
- Firewall features Network Address Translation (NAT), and Stateful Packet Inspection (SPI) protects against Dos attacks
- Traffic Control with Virtual Server (max 24 configurable servers) and DMZ
- UPnP (Universal Plug & Play) and ALGs Support for Internet applications such as Email, FTP, Gaming, Remote Desktop, Net Meeting, Telnet, and more
- Provides Additional Security of Enable/Disable SSID, Internet Access Control (Services, URL and MAC Filtering)
- Supports Multiple and Concurrent IPSec, L2TP and PPTP VPN Pass-Through Sessions
- Flash Memory for Firmware Upgrade, Save/Restore Settings
- Easy Management via Web Browser (HTTP) and Remote Management
- Supports 64/128-bit WEP(for 11b/g), WPA/WPA2, and WPA-PSK/WPA2-PSK
- Compliant with Windows 98/NT/2000/XP/2003 Server/Vista, Linux and Mac OS
- Support 4 x 10/100Mbps Auto-MDIX LAN Port and 1 x 10/100Mbps WAN Port (Internet)
- 3 External Fixed Antennas to support high speed performance and great coverage
- Easy wireless setup via WiFi Protection Setup (PIN).

## ➤ *Hardware Overview*

### Side Panel

#### DC-IN

The DC power input connector is a single jack socket to supply power to the TEW-633GR. Please use the Power Adapter provided on the TEW-633GR package.

#### Reset Button

Pressing the reset button restores the router to its original factory default settings.

#### Auto MDI/MDIX Gigabit WAN Port

This is the connection for the Ethernet cable to the Cable or DSL modem

#### Auto MDI/MDIX Gigabit LAN Ports

These ports automatically sense the cable type when connecting to Ethernet-enabled computers.

## LEDs

### PWR/SYS LED

Solid lights indicate a proper connection to the power supply, and indicate the system ready or not.

### LAN LEDs

Solid lights indicate connections to Ethernet-enabled computers on ports 1-4. LED blinks during data transmission.

### WAN LED

A solid light indicates connection on the WAN port. This LED blinks during data transmission.

### WLAN LED

A solid light indicates that the wireless segment is ready. This LED blinks during wireless data transmission.

### WPS Button

Enable the PBC WPS configuration. The router and the client adapters both require to have WPS support to use this feature .

## Installation Considerations

The TEW-633GR 11n (Draft 2.0) Wireless Router lets you access your network, using a wireless connection, from virtually anywhere within its operating range. Keep in mind, however, that the number, thickness and location of walls, ceilings, or other objects that the wireless signals must pass through, may limit the range. Typical ranges vary depending on the types of materials and background RF (radio frequency) noise in your home or business. The key to maximizing wireless range is to follow these basic guidelines:

- 1 Keep the number of walls and ceilings between the TEW-633GR and other network devices to a minimum - each wall or ceiling can reduce your wireless product's range from 3-90 feet (1-30 meters.) Position your devices so that the number of walls or ceilings is minimized.
- 2 Be aware of the direct line between network devices. A wall that is 1.5 feet thick (.5 meters), at a 45-degree angle appears to be almost 3 feet (1 meter) thick. At a 2-degree angle it looks over 42 feet (14 meters) thick! Position devices so that the signal will travel straight through a wall or ceiling (instead of at an angle) for better reception.
- 3 Building Materials can impede the wireless signal - a solid metal door or aluminum studs may have a negative effect on range. Try to position wireless devices and computers with wireless adapters so that the signal passes through drywall or open doorways and not other materials.
- 4 Keep your product away (at least 3-6 feet or 1-2 meters) from electrical devices or appliances that generate extreme RF noise.

## Getting Started

For a typical wireless setup at home, please do the following:

1. You will need broadband Internet access (a Cable or DSL-subscriber line into your home or office)
2. Consult with your Cable or DSL provider for proper installation of the modem.
3. Connect the Cable or DSL modem to the TEW-633GR Wireless Broadband Router (WAN port).
4. Ethernet LAN ports of the TEW-633GR are Auto-MDIX and will work with both Straight-Through and Cross-Over cable.

# Using the Configuration Menu

Whenever you want to configure your TEW-633GR, you can access the Configuration Menu through your PC by opening the Web-browser and typing in the IP Address of the TEW-633GR. The TEW-633GR's default IP Address is <http://192.168.10.1>

- Open the Web browser.
- Type in the **IP Address** of the Router (<http://192.168.10.1>).

If you have changed the default IP Address assigned to the TEW-633GR, make sure to enter the correct IP Address.

**NOTE**

- Select **admin** in the **User Name** field.
- Leave the **Password** blank.
- Click **Login In**.

# Basic

The Basic tab provides the following configuration options: INTERNET, WIRELESS and NETWORK SETTINGS.

## Basic\_Internet

The screenshot shows the configuration interface for a TRENDnet TEW-633GR Wireless N Gigabit Router. At the top left is the TRENDnet logo. At the top right, the model name "Wireless N Gigabit Router" and part number "TEW-633GR" are displayed. On the left side, there is a vertical menu bar with the following options: Basic (selected), Wizard, Internet, Wireless, Network Settings, Advanced, Tools, Status, and Help. The main content area is titled "Internet Connection". It contains two sections: "Internet Connection Wizard" and "Manual Internet Connection Options". The "Internet Connection Wizard" section includes a note about using the wizard to set up the connection and a "Setup Wizard" button. A note below the button states: "Note: Before launching these wizards, please make sure you have followed all steps outlined in the Quick Installation Guide included in the package." The "Manual Internet Connection Options" section includes a note about manually configuring the router and a "Manual Configure" button.

### Setup Wizard

If you are new to networking and have never configured a router before, click on **Setup Wizard** and the router will guide you through a few simple steps to get your network up and running.

### Manual Configure

If you consider yourself an advanced user and have configured a router before, click **Manual Configure** to input all the settings manually.

# Basic\_Wireless

The wireless section is used to configure the wireless settings for your router. Note that changes made in this section may also need to be duplicated on wireless clients that you want to connect to your wireless network.

To protect your privacy, use the wireless security mode to configure the wireless security features. This device supports three wireless security modes including: WEP, WPA-Personal, and WPA-Enterprise. WEP is the original wireless encryption standard. WPA-Enterprise provides a higher level of security. WPA-Personal does not require an authentication server. The WPA-Enterprise option does require a RADIUS authentication server.

The screenshot shows the configuration interface for a TRENDnet TEW-633GR Wireless N Gigabit Router. The main title is "Wireless N Gigabit Router TEW-633GR". On the left, there's a navigation menu with "Basic" selected, containing links for Wizard, Internet, Wireless (which is bolded), and Network Settings. Below that are Advanced, Tools, Status, and Help. The main content area is titled "Wireless Network Settings" and contains the following sections:

- Wireless Connection Wizard:** A note says to use the Setup Wizard if you want assistance. A "Setup Wizard" button is present.
- Wireless Network Settings:** Includes fields for:
  - Enable Wireless: On
  - Wireless Network Name: TRENDnet (Also called the SSID)
  - Enable Auto Channel Scan: checked
  - Wireless Channel: 2.437 GHz - CH 6
  - 802.11 Mode: Mixed 802.11n, 802.11g and 802.11b
  - Channel Width: 20 MHz
  - Transmission Rate: Best (automatic) (Mbit/s)
  - Visibility Status: Visible (radio button selected)
- Wireless Security Mode:** A note about security modes (WPA-Personal, WPA-Enterprise). A "Security Mode" dropdown is set to None.

At the bottom right, it says "Copyright © 2007 TRENDnet. All Rights Reserved."

## Enable Wireless

This indicates the wireless operating status. The wireless can be turned on or off by the slide switch at the back panel. When the wireless is enabled, the following parameters are in effect.

## **Wireless Network Name**

When you are browsing for available wireless networks, this is the name that will appear in the list (unless Visibility Status is set to Invisible, see below). This name is also referred to as the SSID. For security purposes, it is highly recommended to change from the pre-configured network name.

## **Enable Auto Channel Scan**

If you select this option, the router automatically finds the channel with least interference and uses that channel for wireless networking. If you disable this option, the router uses the channel that you specify with the following **Wireless Channel** option.

## **Wireless Channel**

A wireless network uses specific channels in the wireless spectrum to handle communication between clients. Some channels in your area may have interference from other electronic devices. Choose the clearest channel to help optimize the performance and coverage of your wireless network.

## **802.11 Mode**

If all of the wireless devices you want to connect with this router can connect in the same transmission mode, you can improve performance slightly by choosing the appropriate "Only" mode. If you have some devices that use a different transmission mode, choose the appropriate "Mixed" mode.

## **Channel Width**

The "Auto 20/40 MHz" option is usually best. The other options are available for special circumstances. Note that when 20/40MHz option is selected, an extended channel will be used to extend the data rate.

## **Transmission Rate**

By default the fastest possible transmission rate will be selected. You have the option of selecting the speed if necessary.

## **Visibility Status**

The Invisible option allows you to hide your wireless network. When this option is set to Visible, your wireless network name is broadcast to anyone within the range of your signal. If you're not using encryption then they could connect to your network. When Invisible mode is enabled, you must enter the Wireless Network Name (SSID) on the client manually to connect to the network.

## **Security Mode (NONE, WEP, WPA-Personal, WPA-Enterprise)**

Unless one of these encryption modes is selected, wireless transmissions to and from your wireless network can be easily intercepted and interpreted by unauthorized users.

## **WEP**

A method of encrypting data for wireless communication intended to provide the same level of privacy as a wired network. WEP is not as secure as WPA encryption. To gain access to a WEP network, you must know the key. The key is a string of characters that you create. When using WEP, you must determine the level of encryption. The type of encryption determines the key length. 128-bit encryption requires a longer key than 64-bit encryption. Keys are defined by entering in a string in HEX (hexadecimal - using characters 0-9, A-F) or ASCII (American Standard Code for Information Interchange - alphanumeric characters) format. ASCII format is

provided so you can enter a string that is easier to remember. The ASCII string is converted to HEX for use over the network. Four keys can be defined so that you can change keys easily. A default key is selected for use on the network.

**Example:**

64-bit hexadecimal keys are exactly 10 characters in length. (12345678FA is a valid string of 10 characters for 64-bit encryption.)

128-bit hexadecimal keys are exactly 26 characters in length.  
(456FBCDF123400122225271730 is a valid string of 26 characters for 128-bit encryption.)

64-bit ASCII keys are up to 5 characters in length (DMODE is a valid string of 5 characters for 64-bit encryption.)

128-bit ASCII keys are up to 13 characters in length (2002HALOSWIN1 is a valid string of 13 characters for 128-bit encryption.)

Note that, if you enter fewer characters in the WEP key than required, the remainder of the key is automatically padded with zeros.

### **WPA-Personal and WPA-Enterprise**

Both of these options select some variant of Wi-Fi Protected Access (WPA) -- security standards published by the Wi-Fi Alliance. The **WPA Mode** further refines the variant that the router should employ.

**WPA Mode:** WPA is the older standard; select this option if the clients that will be used with the router only support the older standard. WPA2 is the newer implementation of the stronger IEEE 802.11i security standard. With the "WPA or WPA2" option, the router tries WPA2 first, but falls back to WPA if the client only supports WPA. The strongest cipher that the client supports will be used. With the "WPA2 Only" option, the router associates only with clients that also support WPA2 security. If the clients support the AES cipher, it will be used across the wireless network to ensure best security.

**Group Key Update Interval:** The amount of time before the group key used for broadcast and multicast data is changed.

### **WPA-Personal**

This option uses Wi-Fi Protected Access with a Pre-Shared Key (PSK).

**Pre-Shared Key:** The key is entered as a pass-phrase of up to 63 alphanumeric characters in ASCII (American Standard Code for Information Interchange) format at both ends of the wireless connection. It cannot be shorter than eight characters, although for proper security it needs to be of ample length and should not be a commonly known phrase. This phrase is used to generate session keys that are unique for each wireless client.

**Example:**

**Wireless Networking technology enables ubiquitous communication**

## **WPA-Enterprise**

This option works with a RADIUS Server to authenticate wireless clients. Wireless clients should have established the necessary credentials before attempting to authenticate to the Server through this Gateway. Furthermore, it may be necessary to configure the RADIUS Server to allow this Gateway to authenticate users.

**Authentication Timeout:** Amount of time before a client will be required to re-authenticate.

**RADIUS Server IP Address:** The IP address of the authentication server.

**RADIUS Server Port:** The port number used to connect to the authentication server.

**RADIUS Server Shared Secret:** A pass-phrase that must match with the authentication server.

**MAC Address Authentication:** If this is selected, the user must connect from the same computer whenever logging into the wireless network.

### **Advanced:**

#### **Optional Backup RADIUS Server**

This option enables configuration of an optional second RADIUS server. A second RADIUS server can be used as backup for the primary RADIUS server. The second RADIUS server is consulted only when the primary server is not available or not responding. The fields **Second RADIUS Server IP Address**, **RADIUS Server Port**, **Second RADIUS server Shared Secret**, **Second MAC Address Authentication** provide the corresponding parameters for the second RADIUS Server.

# Basic\_Network Settings

Use this section to configure the internal network settings of your router. The IP Address that is configured here is the IP Address that you use to access the Web-based management interface. If you change the IP Address here, you may need to adjust your PC's network settings to access the network again.

## WAN Port Mode

This option controls how the device reacts to traffic on the WAN connector. In this case the Term "port" refers to the Ethernet connectors on the device.

### Router Mode

Select this option if the WAN port is connected to the Internet, the device functions as a NAT router.

### Bridge Mode

Select this option if the device is connected to a local network downstream from another router. In this mode, the device functions as a bridge between the network on its WAN port and the Devices on its LAN port and those connected wirelessly. The **Router IP Address** field below

must be set to the IP address of this device. The **Gateway** must be set to the IP address of the upstream router. Both addresses must be within the LAN subnet as specified by Subnet Mask.

## Router Settings

These are the settings of the LAN (Local Area Network) interface for the router. The router's local network (LAN) settings are configured based on the IP Address and Subnet Mask assigned in this section. The IP address is also used to access this Web-based management interface. It is recommended that you use the default settings if you do not have an existing network.

### IP Address

The IP address of your router on the local area network. Your local area network settings are based on the address assigned here. For example, 192.168.10.1.

### Subnet Mask

The subnet mask of your router on the local area network.

### Local Domain Name

This entry is optional. Enter a domain name for the local network. The router's DHCP server will give this domain name to the computers on the wireless LAN. So, for example, if you enter **mynetwork.net** here, and you have a wireless laptop with a name of **chris**, that laptop will be known as **chris.mynetwork.net**. Note, however, if the router's settings specify "DHCP (Dynamic)" Address, and the router's DHCP server assigns a domain name to the AP, that domain name will override any name you enter here.

### DNS Relay

When DNS Relay is enabled, the router plays the role of a DNS server. DNS requests sent to the router are forwarded to the ISP's DNS server. This provides a constant DNS address that LAN computers can use, even when the router obtains a different DNS server address from the ISP upon re-establishing the WAN connection. You should disable DNS relay if you implement a LAN-side DNS server as a virtual server.

## RIP (Routing Information Protocol)

Used to broadcast routing information among routers.

### Enable RIP

Enable RIP if required by the ISP, if the LAN has multiple routers, or if the LAN has auto-IP devices.

### RIP Operating mode

This router supports both version 2 and version 1 of the RIP specification.

**V1.** Use if none of the routers supports Version 2.

**V2 Broadcast.** Use if some routers are capable of Version 2, but some are only capable of Version 1.

**V2 Multicast.** Use if this is the only router on the LAN or if all the routers support Version 2.

### Router Metric

The additional cost of routing a packet through this router. The normal value for a simple network is 1. This metric is added to routes learned from other routers; it is not added to static or system routes.

#### **Act as default router**

Make this router the preferred destination for packets that are not otherwise destined.

#### **Allow RIP updates from WAN**

For security, disable this option unless required by the ISP.

#### **RIP Password**

RIP Version 2 supports the use of a password to limit access to routers through the RIP protocol. If the ISP or other LAN router requires a RIP password, enter the password here.

### **DHCP Server Settings**

DHCP stands for Dynamic Host Configuration Protocol. The DHCP section is where you configure the built-in DHCP Server to assign IP addresses to the computers and other devices on your local area network (LAN).

#### **Enable DHCP Server**

Once your router is properly configured and this option is enabled, the DHCP Server will manage the IP addresses and other network configuration information for computers and other devices connected to your Local Area Network. There is no need for you to do this yourself.

The computers (and other devices) connected to your LAN also need to have their TCP/IP configuration set to "DHCP" or "Obtain an IP address automatically".

When you set **Enable DHCP Server**, the following options are displayed.

#### **DHCP IP Address Range**

These two IP values (*from* and *to*) define a range of IP addresses that the DHCP Server uses when assigning addresses to computers and devices on your Local Area Network. Any addresses that are outside of this range are not managed by the DHCP Server; these could, therefore, be used for manually configured devices or devices that cannot use DHCP to obtain network address details automatically.

It is possible for a computer or device that is manually configured to have an address that does reside within this range. In this case the address should be reserved (see [Static DHCP Client](#) below), so that the DHCP Server knows that this specific address can only be used by a specific computer or device.

Your router, by default, has a static IP address of 192.168.10.1. This means that addresses 192.168.10.2 to 192.168.10.254 can be made available for allocation by the DHCP Server.

#### **Example:**

Your router uses 192.168.10.1 for the IP address. You've assigned a computer that you want to designate as a Web server with a static IP address of 192.168.10.3. You've assigned another computer that you want to designate as an FTP server with a static IP address of 192.168.10.4. Therefore the starting IP address for your DHCP IP address range needs to be 192.168.10.5 or greater.

#### **Example:**

Suppose you configure the DHCP Server to manage addresses from 192.168.10.101 To 192.168.10.200. This means that 192.168.10.2 to 192.168.10.100 and 192.168.10.201 to 192.168.10.254 is NOT managed by the DHCP Server. Computers or devices that use addresses from these ranges are to be manually configured. Suppose you have a web server computer that has a manually configured address of 192.168.10.150. Because this falls within the "managed range" be sure to create a reservation for this address and match it to the relevant computer (see [Static DHCP Client](#) below).

### DHCP Lease Time

The amount of time that a computer may have an IP address before it is required to renew the lease. The lease functions just as a lease on an apartment would. The initial lease designates the amount of time before the lease expires. If the tenant wishes to retain the address when the lease is expired then a new lease is established. If the lease expires and the address is no longer needed than another tenant may use the address.

## **Always Broadcast**

If all the computers on the LAN successfully obtain their IP addresses from the router's DHCP server as expected, this option can remain disabled. However, if one of the computers on the LAN fails to obtain an IP address from the router's DHCP server, it may have an old DHCP client that incorrectly turns off the broadcast flag of DHCP packets. Enabling this option will cause the router to always broadcast its responses to all clients, thereby working around the problem, at the cost of increased broadcast traffic on the LAN.

## **Add/Edit DHCP Reservation**

This option lets you reserve IP addresses, and assign the same IP address to the network device with the specified MAC address any time it requests an IP address. This is almost the same as when a device has a static IP address except that the device must still request an IP address from the router. The router will provide the device the same IP address every time. DHCP Reservations are helpful for server computers on the local network that are hosting applications such as Web and FTP. Servers on your network should either use a static IP address or use this option.

### **Computer Name**

You can assign a name for each computer that is given a reserved IP address. This may help you keep track of which computers are assigned this way. Example: **Game Server**.

### **IP Address:**

The LAN address that you want to reserve.

### **MAC Address**

To input the MAC address of your system, enter it in manually or connect to the router's Web-Management interface from the system and click the **Copy Your PC's MAC Address** button.

A MAC address is usually located on a sticker on the bottom of a network device. The MAC address is comprised of twelve digits. Each pair of hexadecimal digits are usually separated by dashes or colons such as 00-0D-88-11-22-33 or 00:0D:88:11:22:33. If your network device is a computer and the network card is already located inside the computer, you can connect to the router from the computer and click the **Copy Your PC's MAC Address** button to enter the MAC address.

As an alternative, you can locate a MAC address in a specific operating system by following the steps below:

- |               |  |
|---------------|--|
| Windows 98    | Go to the Start menu, select Run, type in <b>winipcfg</b> , and hit Enter. A popup window will be displayed. Select the appropriate adapter from the pull-down menu and you will see the Adapter Address. This is the MAC address of the device. |
| Windows Me    | Go to the Start menu, select Run, type in <b>winipcfg</b> , and hit Enter. A popup window will be displayed. Select the appropriate adapter from the pull-down menu and you will see the Adapter Address. This is the MAC address of the device. |
| Windows 2000  | Go to your Start menu, select Programs, select Accessories, and select Command Prompt. At the command prompt type <b>ipconfig /all</b> and hit Enter.  |
| Windows XP    | The physical address displayed for the adapter connecting to the router is the MAC address.  |
| Windows Vista | Go to your Start menu, select Programs, select Accessories, and select Command Prompt. At the command prompt type <b>ipconfig /all</b> and hit Enter.  |
| Mac OS X      | The physical address displayed for the adapter connecting to the router is the MAC address.  |
|               | Go to the Apple Menu, select System Preferences, select Network, and select the Ethernet Adapter connecting to the router. Select the Ethernet button and the Ethernet ID will be listed. This is the same as the MAC address.                   |

## DHCP Reservations List

This shows clients that you have specified to have reserved DHCP addresses. An entry can be changed by clicking the Edit icon, or deleted by clicking the Delete icon. When you click the Edit icon, the item is highlighted, and the "Edit DHCP Reservation" section is activated for editing.

## Number of Dynamic DHCP Clients

In this section you can see what LAN devices are currently leasing IP addresses.

### Revoke

The **Revoke** option is available for the situation in which the lease table becomes full or nearly full, you need to recover space in the table for new entries, and you know that some of the currently allocated leases are no longer needed. Clicking **Revoke** cancels the lease for a specific LAN device and frees an entry in the lease table. Do this only if the device no longer needs the leased IP address, because, for example, it has been removed from the network.

### Reserve

The **Reserve** option converts this dynamic IP allocation into a DHCP Reservation and adds the corresponding entry to the DHCP Reservations List.

# Advanced

The Advanced tab provides the following configuration options: **Virtual Server, Special Applications, Gaming, StreamEngine, Routing, Access Control, WEB Filter, MAC Address Filter, Firewall, Inbound Filter, Advanced Wireless and Advanced Network.**

## Advanced\_Virtual Server

The Virtual Server option gives Internet users access to services on your LAN. This feature is useful for hosting online services such as FTP, Web, or game servers. For each Virtual Server, you define a public port on your router for redirection to an internal LAN IP Address and LAN port.

### Example:

You are hosting a Web Server on a PC that has LAN IP Address of 192.168.10.50 and your ISP is blocking Port 80.

1. Name the Virtual Server (for example: **Web Server**)
2. Enter the IP Address of the machine on your LAN (for example: **192.168.10.50**)
3. Enter the Private Port as [80]

4. Enter the Public Port as [8888]
5. Select the Protocol (for example **TCP**).
6. Ensure the schedule is set to **Always**
7. Click **Save** to add the settings to the Virtual Servers List
8. Repeat these steps for each Virtual Server Rule you wish to add. After the list is complete, click **Save Settings** at the top of the page.

With this Virtual Server entry, all Internet traffic on Port 8888 will be redirected to your internal web server on port 80 at IP Address 192.168.10.50.

## Virtual Server Parameters

### Name

Assign a meaningful name to the virtual server, for example **Web Server**. Several well-known types of virtual server are available from the "Application Name" drop-down list. Selecting one of these entries fills some of the remaining parameters with standard values for that type of server.

### IP Address

The IP address of the system on your internal network that will provide the virtual service, for example **192.168.10.50**. You can select a computer from the list of DHCP clients in the "Computer Name" drop-down menu, or you can manually enter the IP address of the server computer.

### Protocol

Select the protocol used by the service. The common choices -- UDP, TCP, and both UDP and TCP -- can be selected from the drop-down menu. To specify any other protocol, select "Other" from the list, then enter the corresponding protocol number ([as assigned by the IANA](#)) in the **Protocol** box.

### Private Port

The port that will be used on your internal network.

### Public Port

The port that will be accessed from the Internet.

### Inbound Filter

Select a filter that controls access as needed for this virtual server. If you do not see the filter you need in the list of filters, go to the [Advanced → Inbound Filter](#) screen and create a new filter.

### Schedule

Select a schedule for when the service will be enabled. If you do not see the schedule you need in the list of schedules, go to the [Tools → Schedules](#) screen and create a new schedule.

## Add/Edit Virtual Server

In this section you can add an entry to the Virtual Servers List below or edit an existing entry.

### Enable

Entries in the list can be either active (enabled) or inactive (disabled).

### Save

Saves the new or edited virtual server entry in the following list. When finished updating the virtual server entries, you must still click the **Save Settings** button at the top of the page to make the changes effective and permanent.

## Virtual Servers List

The section shows the currently defined virtual servers. A Virtual Server can be changed by clicking the Edit icon, or deleted by clicking the Delete icon. When you click the Edit icon, the item is highlighted, and the "Edit Virtual Server" section is activated for editing.

You might have trouble accessing a virtual server using its public identity (WAN-side IP-address of the gateway or its dynamic DNS name) from a machine on the LAN. Your requests may not be looped back or you may be redirected to the "Forbidden" page.

This will happen if you have an Access Control Rule configured for this LAN machine.

The requests from the LAN machine will not be looped back if Internet access is blocked at the time of access. To work around this problem, access the LAN machine using its LAN-side identity.

Requests may be redirected to the "Forbidden" page if web access for the LAN machine is restricted by an Access Control Rule. Add the WAN-side identity (WAN-side IP-address of the router or its dynamic DNS name) on the [Advanced → Web Filter](#) screen to work around this problem.

# Advanced\_Special Applications

An application rule is used to open single or multiple ports on your router when the router senses data sent to the Internet on a "trigger" port or port range. An application rule applies to all computers on your internal network.

## Parameters for an Application Rule

### Example:

You need to configure your router to allow a software application running on any computer on your network to connect to a web-based server or another user on the Internet.

### Name

Enter a name for the Special Application Rule, for example **Game App**, which will help you identify the rule in the future. Alternatively, you can select from the **Application** list of common applications.

### Application

Instead of entering a name for the Special Application rule, you can select from this list of common applications, and the remaining configuration values will be filled in accordingly.

### Trigger Port Range

Enter the outgoing port range used by your application (for example **6500-6700**).

### **Trigger Protocol**

Select the outbound protocol used by your application (for example **Both**).

### **Input Port Range**

Enter the port range that you want to open up to Internet traffic (for example **6000-6200**).

### **Input Protocol**

Select the protocol used by the Internet traffic coming back into the router through the opened port range (for example **Both**).

### **Schedule**

Select a schedule for when this rule is in effect. If you do not see the schedule you need in the list of schedules, go to the [Tools → Schedules](#) screen and create a new schedule.

With the above example application rule enabled, the router will open up a range of ports from 6000-6200 for incoming traffic from the Internet, whenever any computer on the internal network opens up an application that sends data to the Internet using a port in the range of 6500-6700.

## **Add/Edit Special Applications Rule**

This section is where you define and edit Special Applications Rules.

### **Save**

Saves the new or edited Special Applications Rule in the following list. When finished updating the special applications rules, you must still click the **Save Settings** button at the top of the page to make the changes effective and permanent.

## **Special Applications Rules List**

The section shows the currently defined special applications rules. A special applications rule can be changed by clicking the Edit icon, or deleted by clicking the Delete icon. When you click the Edit icon, the item is highlighted, and the "Edit Special Applications Rule" section is activated for editing.

## Advanced\_Gaming

Multiple connections are required by some applications, such as internet games, video conferencing, Internet telephony, and others. These applications have difficulties working through NAT (Network Address Translation). This section is used to open multiple ports or a range of ports in your router and redirect data through those ports to a single PC on your network. You can enter ports in various formats:

Range (50-100)

Individual (80, 68, 888)

Mixed (1020-5000, 689)

The screenshot shows the 'Gaming' configuration page of the TRENDnet TEW-633GR router. The left sidebar has a 'Basic' button, an 'Advanced' button (which is selected and highlighted in blue), and 'Virtual Server', 'Special Applications', 'Gaming' (selected), 'Streamengine', 'Routing', 'Access Control', 'Web Filter', 'MAC Address Filter', 'Firewall', 'Inbound Filter', 'Advanced Wireless', 'Advanced Network', 'WISH', and 'Wi-Fi Protected Setup' buttons. The main content area has a title 'Gaming' with a sub-instruction: 'This option is used to open multiple ports or a range of ports in your router and redirect data through those ports to a single PC on your network. This feature allows you to enter ports in various formats including, Port Ranges (100-150), Individual Ports (80, 68, 888), or Mixed (1020-5000, 689)'. Below this are two buttons: 'Save Settings' and 'Don't Save Settings'. The central part is titled 'Add Game Rule' and contains fields for 'Enabled' (checkbox), 'Name' (dropdown menu showing 'Application Name'), 'IP Address' (dropdown menu showing 'Computer Name'), 'TCP Ports to Open' (text input field), 'UDP Ports to Open' (text input field), 'Inbound Filter' (dropdown menu showing 'Allow All' with 'Details: Everyone allowed'), and 'Schedule' (dropdown menu showing 'Always' with 'Details: Always'). At the bottom are 'Save' and 'Clear' buttons. Below this is a 'Game Rules List' table with columns: Enabled, Name, IP Address, TCP Ports, UDP Ports, Inbound Filter, and Schedule. The table currently has one row. At the very bottom is a copyright notice: 'Copyright © 2007 TRENDnet. All Rights Reserved.'

### Example:

Suppose you are hosting an online game server that is running on a PC with a private IP Address of 192.168.10.50. This game requires that you open multiple ports (6159-6180, 99) on the router so Internet users can connect.

## Port Forwarding Fields

### Name

Give the rule a name that is meaningful to you, for example **Game Server**. You can also select from a list of popular games, and many of the remaining configuration values will be filled in accordingly. However, you should check whether the port values have changed since this list was created, and you must fill in the IP address field.

### IP Address

Enter the local network IP address of the system hosting the server, for example **192.168.10.50**.

### TCP Ports To Open

Enter the TCP ports to open (for example **6159-6180, 99**).

### UDP Ports To Open

Enter the UDP ports to open (for example **6159-6180, 99**).

### Inbound Filter

Select a filter that controls access as needed for this rule. If you do not see the filter you need in the list of filters, go to the [Advanced → Inbound Filter](#) screen and create a new filter.

### Schedule

Select a schedule for the times when this rule is in effect. If you do not see the schedule you need in the list of schedules, go to the [Tools → Schedules](#) screen and create a new schedule.

With the above example values filled in and this Gaming Rule enabled, all TCP and UDP traffic on ports 6159 through 6180 and port 99 is passed through the router and redirected to the Internal Private IP Address of your Game Server at 192.168.10.50.

## Edit/Add Game Rule

Here you can add entries to the Game Rules List below, or edit existing entries.

### Enable

Each entry in Game Rules List can be active (enabled) or inactive (disabled)

### Save

Saves the new or edited Game Rule in the following list. When finished updating the game rules, you must still click the **Save Settings** button at the top of the page to make the changes effective and permanent.

## Game Rules List

The section shows the currently defined game rules. A game rule can be changed by clicking the Edit icon, or deleted by clicking the Delete icon. When you click the Edit icon, the item is highlighted, and the "Edit Game Rule" section is activated for editing.

# Advanced StreamEngine

The StreamEngine feature helps improve your network gaming performance by prioritizing the data flows of network applications.

The screenshot shows the StreamEngine configuration page of the TRENDnet TEW-633GR router. The left sidebar has a 'Basic' tab, an 'Advanced' tab (selected), and 'Tools', 'Status', 'Help' tabs. The main content area has a 'StreamEngine' title. It includes a brief description of StreamEngine's purpose, two 'Save Settings' and 'Don't Save Settings' buttons, and three sections: 'StreamEngine Setup', 'Add StreamEngine Rule', and 'StreamEngine Rules List'.

**StreamEngine Setup:**

- Enable StreamEngine:
- Automatic Classification:
- Dynamic Fragmentation:
- Automatic Uplink Speed:
- Measured Uplink Speed: Not Estimated
- Manual Uplink Speed: 128 kbps << 128 kbps
- Connection Type: Auto-detect
- Detected xDSL or Other Frame Relay Network: No

**Add StreamEngine Rule:**

- Enable:
- Name: [highlighted field]
- Priority: [empty field] (1..255, 255 is the lowest priority)
- Protocol: 0 << Select Protocol
- Source IP Range: 0.0.0.0 to 255.255.255.255
- Source Port Range: 0 to 65535
- Destination IP Range: 0.0.0.0 to 255.255.255.255
- Destination Port Range: 0 to 65535

**StreamEngine Rules List:**

Enable	Name	Priority	Source IP Range	Destination IP Range	Protocol / Ports

Copyright © 2007 TRENDnet. All Rights Reserved.

## StreamEngine Setup

### Enable StreamEngine

Enable this option for better performance and experience with online games and other interactive applications, such as VoIP.

## Automatic Classification

This option is enabled by default so that your router will automatically determine which programs should have network priority.

## Dynamic Fragmentation

This option should be enabled when you have a slow Internet uplink. It helps to reduce the impact that large low priority network packets can have on more urgent ones by breaking the large packets into several smaller packets.

## Automatic Uplink Speed

When enabled, this option causes the router to automatically measure the useful uplink bandwidth each time the WAN interface is re-established (after a reboot, for example).

## Measured Uplink Speed

This is the uplink speed measured when the WAN interface was last re-established. The value may be lower than that reported by your ISP as it does not include all of the network protocol overheads associated with your ISP's network. Typically, this figure will be between 87% and 91% of the stated uplink speed for xDSL connections and around 5 kbps lower for cable network connections.

## Manual Uplink Speed

If Automatic Uplink Speed is disabled, this options allows you to set the uplink speed manually. Uplink speed is the speed at which data can be transferred from the router to your ISP. This is determined by your ISP. ISPs often specify speed as a downlink/uplink pair; for example, 1.5Mbps/284kbps. For this example, you would enter "284".

Alternatively you can test your uplink speed with a service such as [www.dsreports.com](http://www.dsreports.com). Note however that sites such as DSL Reports, because they do not consider as many network protocol overheads, will generally note speeds slightly lower than the Measured Uplink Speed or the ISP rated speed.

## Connection Type

By default, the router automatically determines whether the underlying connection is an xDSL/Frame-relay network or some other connection type (such as cable modem or Ethernet), and it displays the result as **Detected xDSL or Frame Relay Network**. If you have an unusual network connection in which you are actually connected via xDSL but for which you configure either "Static" or "DHCP" in the WAN settings, setting this option to **xDSL or Other Frame Relay Network** ensures that the router will recognize that it needs to shape traffic slightly differently in order to give the best performance. Choosing **xDSL or Other Frame Relay Network** causes the measured uplink speed to be reported slightly lower than before on such connections, but gives much better results.

## Detected xDSL or Frame Relay Network

When **Connection Type** is set to **Auto-detect**, the automatically detected connection type is displayed here.

## StreamEngine Rules

A StreamEngine Rule identifies a specific message flow and assigns a priority to that flow. For most applications, automatic classification will be adequate, and specific StreamEngine Rules will not be required.

Conflicting rules are not permitted. Conflicting rules are those that share any combination of source address/port, destination address/port, and protocol. Rejecting conflicting rules ensures that every flow defined in a rule receives the expected priority and avoids indeterminate prioritization that could reduce QoS effectiveness.

### Name

Create a name for the rule that is meaningful to you.

### Priority

The priority of the message flow is entered here -- 1 receives the highest priority (most urgent) and 255 receives the lowest priority (least urgent). Priority 0 is reserved. Flows that are not prioritized by any rule receive lowest priority.

### Protocol

The protocol used by the messages. The common choices can be selected from the drop-down menu. To specify any other protocol, enter its protocol number ([as assigned by the IANA](#)) in the **Protocol** box.

### Source IP Range

The rule applies to a flow of messages whose LAN-side IP address falls within the range set here.

### Source Port Range

The rule applies to a flow of messages whose LAN-side port number is within the range set here.

### Destination IP Range

The rule applies to a flow of messages whose WAN-side IP address falls within the range set here.

### Destination Port Range

The rule applies to a flow of messages whose WAN-side port number is within the range set here.

## Add/Edit StreamEngine Rule

### Enable

Each entry in StreamEngine Rules List can be active (enabled) or inactive (disabled)

### Save

Saves the new or edited StreamEngine Rule in the following list. When finished updating the StreamEngine rules, you must still click the **Save Settings** button at the top of the page to make the changes effective and permanent.

## StreamEngine Rules List

The section shows the currently defined StreamEngine rules. A StreamEngine rule can be changed by clicking the Edit icon, or deleted by clicking the Delete icon. When you click the Edit icon, the item is highlighted, and the "Edit StreamEngine Rule" section is activated for editing.

# Advanced\_Routing

The screenshot shows the 'Advanced' tab selected in the left sidebar. The main content area is titled 'Routing' with the sub-instruction: 'The Routing option allows you to define fixed routes to defined destinations.' Below this are two buttons: 'Save Settings' and 'Don't Save Settings'. The central part of the screen is titled 'Add Route' and contains fields for 'Enable' (checked), 'Destination IP' (0.0.0.0), 'Netmask' (0.0.0.0), 'Gateway' (0.0.0.0), 'Interface' (WAN), and 'Metric' (1). At the bottom of this section are 'Save' and 'Clear' buttons. To the right is a 'Routes List' table with columns: Enable, Destination IP, Netmask, Gateway, Metric, and Interface. A single row is shown: 192.168.1.0, 255.255.255.0, 0.0.0.0, 1, LAN, System. Below this is a 'Existing routes' table with columns: Destination IP, Netmask, Gateway, Metric, Interface, and Creator. A single row is shown: 192.168.1.0, 255.255.255.0, 0.0.0.0, 1, LAN, System. At the bottom right of the interface is the copyright notice: 'Copyright © 2007 TRENDnet. All Rights Reserved.'

## Add/Edit Route

Adds a new route to the IP routing table or edits an existing route.

**Enable:** Specifies whether the entry will be enabled or disabled.

**Destination IP:** The IP address of packets that will take this route.

**Netmask:** One bits in the mask specify which bits of the IP address must match.

**Gateway:** Specifies the next hop to be taken if this route is used. A gateway of 0.0.0.0 implies there is no next hop, and the IP address matched is directly connected to the router on the interface specified: LAN or WAN.

**Interface:** Specifies the interface -- LAN or WAN -- that the IP packet must use to transit out of the router, when this route is used.

**Metric:** The route metric is a value from 1 to 16 that indicates the cost of using this route. A value of 1 is the lowest cost, and 15 is the highest cost. A value of 16 indicates that the route is not reachable from this router. When trying to reach a particular destination, computers on your network will select the best route, ignoring unreachable routes.

**Save:** Saves the new or edited route in the following list. When finished updating the routing table, you must still click the **Save Settings** button at the top of the page to make the changes effective and permanent.

## Routes List

The section shows the current routing table entries. Certain required routes are predefined and cannot be changed. Routes that you add can be changed by clicking the Edit icon, or deleted by clicking the Delete icon. When you click the Edit icon, the item is highlighted, and the "Edit Route" section is activated for editing.

## Advanced Access Control

The Access Control section allows you to control access in and out of devices on your network. Use this feature as Parental Controls to only grant access to approved sites, limit web access based on time or dates, and/or block access from applications such as peer-to-peer utilities or games.

### Enable

By default, the Access Control feature is disabled. If you need Access Control, check this option.

When Access Control is disabled, every device on the LAN has unrestricted access to the Internet. However, if you enable Access Control, Internet access is restricted for those devices that have an Access Control Policy configured for them. All other devices have unrestricted access to the Internet.

### Policy Wizard

The Policy Wizard guides you through the steps of defining each access control policy. A policy is the "Who, What, When, and How" of access control -- whose computer will be affected by the control, what internet addresses are controlled, when will the control be in effect, and how is the control implemented. You can define multiple policies. The Policy Wizard starts when you click the button below and also when you edit an existing policy.

### Add Policy

Click this button to start creating a new access control policy.

### Policy Table

This section shows the currently defined access control policies. A policy can be changed by clicking the Edit icon, or deleted by clicking the Delete icon. When you click the Edit icon, the Policy Wizard starts and guides you through the process of changing a policy. You can enable or disable specific policies in the list by clicking the "Enable" checkbox.

# Advanced\_WEB Filter

This section is where you add the Web sites to be used for Access Control. The Web sites listed here are used when the Web Filter option is enabled in [Access Control](#).

The Web Filter section is one of two means by which you can specify the web sites you want to allow.

The screenshot shows the router's configuration interface with the following details:

- Header:** TRENDnet logo and "Wireless N Gigabit Router TEW-633GR".
- Left Sidebar (Advanced tab selected):**
  - Virtual Server
  - Special Applications
  - Gaming
  - Streamengine
  - Routing
  - Access Control
  - Web Filter** (selected)
  - MAC Address Filter
  - Firewall
  - Inbound Filter
  - Advanced Wireless
  - Advanced Network
  - WISH
  - Wi-Fi Protected Setup
- Top Center:** "Web Filter" section with a descriptive text about setting up allowed websites.
- Middle Center:** "Add Web Site" form with fields for "Enable" (checkbox), "Web Site" (text input field with placeholder "(e.g.: www.trendnet.com)"), and "Save" / "Clear" buttons.
- Bottom Center:** "Website Filtering Rules" section with an "Enable Web Site" button.
- Bottom Left:** "Tools" tab.

## Web Filter Parameters

### Web Site

Enter the address of the web site that you want to allow; for example: **trendnet.com**. Do not enter the **http://** preceding the address. Enter the most inclusive domain; for example, enter **t** and access will be permitted to both **www.trendnet.com** and **support.trendnet.com**.

Many web sites construct pages with images and content from other web sites. Access will be forbidden if you do not enable all the web sites used to construct a page. For example, to access **my.yahoo.com**, you need to enable access to **yahoo.com**, **yimg.com**, and **doubleclick.net**.

### Add/Edit Web Site

This is where you can add Web sites to the Allowed Web Site List or change entries in the Allowed Web Site List.

### **Enable**

Entries in the Allowed Web Site List can be activated or deactivated with this checkbox. New entries are activated by default.

### **Save**

Saves the new or edited Allowed Web Site in the following list. When finished updating the Allowed Web Site List, you must still click the **Save Settings** button at the top of the page to make the changes effective and permanent.

### **Allowed Web Site List**

The section lists the currently allowed web sites. An allowed web site can be changed by clicking the Edit icon, or deleted by clicking the Delete icon. When you click the Edit icon, the item is highlighted, and the "Edit Web Site" section is activated for editing.

# Advanced\_MAC Address Filter

The MAC address filter section can be used to filter network access by machines based on the unique MAC addresses of their network adapter(s). It is most useful to prevent unauthorized wireless devices from connecting to your network. A MAC address is a unique ID assigned by the manufacturer of the network adapter.

The screenshot shows the router's web-based configuration interface. The top header includes the TRENDnet logo, the model name "Wireless N Gigabit Router TEW-633GR", and a "MAC Address Filter" tab. The left sidebar has a "Basic" tab and a "Advanced" tab which is currently selected, listing various configuration options. The main content area is titled "MAC Address Filter". It contains a brief description of what the MAC filter does, two "Save Settings" and "Don't Save Settings" buttons, and a "MAC Filtering Setup" section with checkboxes for enabling the filter, selecting mode (allow listed machines), and filtering wireless and wired clients. Below this is an "Add MAC Filtering Rule" section with fields for enabling the rule, entering a MAC address (with a "Copy Your PC's MAC Address" button), and specifying a computer name. At the bottom is a "MAC Filtering Rules" table with columns for Enable, Name, and MAC Address. The footer copyright notice reads "Copyright © 2007 TRENDnet. All Rights Reserved."

## Enable MAC Address Filter

When this is enabled, computers are granted or denied network access depending on the mode of the filter.

Misconfiguration of this feature can prevent any machine from accessing the network. In such a situation, you can regain access by activating the factory defaults button on the router itself.

## Filter Settings

### Mode

When "only allow listed machines" is selected, only computers with MAC addresses listed in the MAC Address List are granted network access. When "only deny listed machines" is selected, any computer with a MAC address listed in the MAC Address List is refused access to the network.

### Filter Wireless Clients

When this is selected, the MAC address filters will be applied to wireless network clients.

### Filter Wired Clients

When this is selected, the MAC address filters will be applied to wired network clients.

## Add/Edit MAC Address

In this section, you can add entries to the MAC Address List below, or edit existing entries.

### Enable

MAC address entries can be activated or deactivated with this checkbox.

### MAC Address

Enter the MAC address of the desired computer or connect to the router from the desired computer and click the **Copy Your PC's MAC Address** button.

### Save

Saves the new or edited MAC Address entry in the following list. When finished updating the MAC Address List, you must still click the **Save Settings** button at the top of the page to make the changes effective and permanent.

## MAC Address List

The section lists the current MAC Address filters. A MAC Address entry can be changed by clicking the Edit icon, or deleted by clicking the Delete icon. When you click the Edit icon, the item is highlighted, and the "Edit MAC Address" section is activated for editing.

## Advanced\_Firewall

The router provides a tight firewall by virtue of the way NAT works. Unless you configure the router to the contrary, the NAT does not respond to unsolicited incoming requests on any port, thereby making your LAN invisible to Internet cyber attackers. However, some network applications cannot run with a tight firewall. Those applications need to selectively open ports in the firewall to function correctly. The options on this page control several ways of opening the firewall to address the needs of specific types of applications. See also [Virtual Server](#), [Port Forwarding](#), [Application Rules](#), and [UPnP](#) for related options.

The screenshot shows the configuration interface for a TRENDnet TEW-633GR Wireless N Gigabit Router. The main title is "Wireless N Gigabit Router TEW-633GR". On the left, there's a navigation menu with tabs: Basic, Advanced (selected), Tools, Status, and Help. Under the Advanced tab, there's a list of options: Virtual Server, Special Applications, Gaming, Streamengine, Routing, Access Control, Web Filter, MAC Address Filter, Firewall (selected), Inbound Filter, Advanced Wireless, Advanced Network, WISH, and Wi-Fi Protected Setup. The main content area is titled "Firewall Settings" and contains the following sections:

- Firewall Settings:** A note says "The Firewall Settings allow you to set a single computer on your network outside of the router." It has two buttons: "Save Settings" and "Don't Save Settings".
  - Enable SPI:** A checked checkbox.
- NAT Endpoint Filtering:**
  - UDP Endpoint Filtering:** Radio buttons for Endpoint Independent (unchecked), Address Restricted (checked), and Port And Address Restricted (unchecked).
  - TCP Endpoint Filtering:** Radio buttons for Endpoint Independent (unchecked), Address Restricted (unchecked), and Port And Address Restricted (checked).
- DMZ Host:** A note says "The DMZ (Demilitarized Zone) option lets you set a single computer on your network outside of the router. If you have a computer that cannot run Internet applications successfully from behind the router, then you can place the computer into the DMZ for unrestricted Internet access." It has a note: "Note: Putting a computer in the DMZ may expose that computer to a variety of security risks. Use of this option is only recommended as a last resort." A checkbox labeled "Enable DMZ" is unchecked.
- Non-UDP/TCP/ICMP LAN Sessions:** A checked checkbox labeled "Enable".
- Application Level Gateway (ALG) Configuration:** A table with checkboxes for various protocols:

PPTP :	<input checked="" type="checkbox"/>
IPSec (VPN) :	<input checked="" type="checkbox"/>
RTSP :	<input checked="" type="checkbox"/>
Windows/MSN Messenger :	<input checked="" type="checkbox"/> (automatically disabled if UPnP is enabled)
FTP :	<input checked="" type="checkbox"/>
H.323 (NetMeeting) :	<input checked="" type="checkbox"/>
SIP :	<input checked="" type="checkbox"/>
Wake-On-LAN :	<input checked="" type="checkbox"/>
MMS :	<input checked="" type="checkbox"/>

## Firewall Settings

### Enable SPI

SPI ("stateful packet inspection" also known as "dynamic packet filtering") helps to prevent cyber attacks by tracking more state per session. It validates that the traffic passing through that session conforms to the protocol. When the protocol is TCP, SPI checks that packet sequence numbers are within the valid range for the session, discarding those packets that do not have valid sequence numbers.

Whether SPI is enabled or not, the router always tracks TCP connection states and ensures that each TCP packet's flags are valid for the current state.

## NAT Endpoint Filtering

The NAT Endpoint Filtering options control how the router's NAT manages incoming connection requests to ports that are already being used.

### Endpoint Independent

Once a LAN-side application has created a connection through a specific port, the NAT will forward any incoming connection requests with the same port to the LAN-side application regardless of their origin. This is the least restrictive option, giving the best connectivity and allowing some applications (P2P applications in particular) to behave almost as if they are directly connected to the Internet.

### Address Restricted

The NAT forwards incoming connection requests to a LAN-side host only when they come from the same IP address with which a connection was established. This allows the remote application to send data back through a port different from the one used when the outgoing session was created.

### Port And Address Restricted

The NAT does not forward any incoming connection requests with the same port address as an already established connection.

Note that some of these options can interact with other port restrictions. Endpoint Independent Filtering takes priority over inbound filters or schedules, so it is possible for an incoming session request related to an outgoing session to enter through a port in spite of an active inbound filter on that port. However, packets will be rejected as expected when sent to blocked ports (whether blocked by schedule or by inbound filter) for which there are no active sessions. Port and Address Restricted Filtering ensures that inbound filters and schedules work precisely, but prevents some level of connectivity, and therefore might require the use of port triggers, virtual servers, or port forwarding to open the ports needed by the application. Address Restricted Filtering gives a compromise position, which avoids problems when communicating with certain other types of NAT router (symmetric NATs in particular) but leaves inbound filters and scheduled access working as expected.

### UDP Endpoint Filtering

Controls endpoint filtering for packets of the UDP protocol.

### TCP Endpoint Filtering

Controls endpoint filtering for packets of the TCP protocol.

## **DMZ Host**

DMZ means "Demilitarized Zone." If an application has trouble working from behind the router, you can expose one computer to the Internet and run the application on that computer.

When a LAN host is configured as a DMZ host, it becomes the destination for all incoming packets that do not match some other incoming session or rule. If any other ingress rule is in place, that will be used instead of sending packets to the DMZ host; so, an active session, virtual server, active port trigger, or port forwarding rule will take priority over sending a packet to the DMZ host. (The DMZ policy resembles a default port forwarding rule that forwards every port that is not specifically sent anywhere else.)

The router provides only limited firewall protection for the DMZ host. The router does not forward a TCP packet that does not match an active DMZ session, unless it is a connection establishment packet (SYN). Except for this limited protection, the DMZ host is effectively "outside the firewall". Anyone considering using a DMZ host should also consider running a firewall on that DMZ host system to provide additional protection.

Packets received by the DMZ host have their IP addresses translated from the WAN-side IP address of the router to the LAN-side IP address of the DMZ host. However, port numbers are not translated; so applications on the DMZ host can depend on specific port numbers.

The DMZ capability is just one of several means for allowing incoming requests that might appear unsolicited to the NAT. In general, the DMZ host should be used only if there are no other alternatives, because it is much more exposed to cyber attacks than any other system on the LAN. Thought should be given to using other configurations instead: a virtual server, a port forwarding rule, or a port trigger. Virtual servers open one port for incoming sessions bound for a specific application (and also allow port redirection and the use of ALGs). Port forwarding is rather like a selective DMZ, where incoming traffic targeted at one or more ports is forwarded to a specific LAN host (thereby not exposing as many ports as a DMZ host). Port triggering is a special form of port forwarding, which is activated by outgoing traffic, and for which ports are only forwarded while the trigger is active.

Few applications truly require the use of the DMZ host. Following are examples of when a DMZ host might be required:

- A host needs to support several applications that might use overlapping ingress ports such that two port forwarding rules cannot be used because they would potentially be in conflict.
- To handle incoming connections that uses a protocol other than ICMP, TCP, UDP, and IGMP (also GRE and ESP, when these protocols are enabled by the PPTP and IPSec ALGs ).

## **Enable DMZ**

Putting a computer in the DMZ may expose that computer to a variety of security risks. Use of this option is only recommended as a last resort.

## **DMZ IP Address**

Specify the LAN IP address of the LAN computer that you want to have unrestricted Internet communication. If this computer obtains its address automatically using DHCP, then you may want to make a static reservation on the [Basic → Network Settings](#) page so that the IP address of the DMZ computer does not change.

## **Non-UDP/TCP/ICMP LAN Sessions**

When a LAN application that uses a protocol other than UDP, TCP, or ICMP initiates a session to the Internet, the router's NAT can track such a session, even though it does not recognize the protocol. This feature is useful because it enables certain applications (most importantly a single VPN connection to a remote host) without the need for an ALG.

Note that this feature does not apply to the DMZ host (if one is enabled). The DMZ host always handles these kinds of sessions.

### **Enable**

Enabling this option (the default setting) enables single VPN connections to a remote host. (But, for multiple VPN connections, the appropriate VPN ALG must be used.) Disabling this option, however, only disables VPN if the appropriate VPN ALG is also disabled.

## **Application Level Gateway (ALG) Configuration**

Here you can enable or disable ALGs. Some protocols and applications require special handling of the IP payload to make them work with network address translation (NAT). Each ALG provides special handling for a specific protocol or application. A number of ALGs for common applications are enabled by default.

### **PPTP**

Allows multiple machines on the LAN to connect to their corporate networks using PPTP protocol. When the PPTP ALG is enabled, LAN computers can establish PPTP VPN connections either with the same or with different VPN servers. When the PPTP ALG is disabled, the router allows VPN operation in a restricted way -- LAN computers are typically able to establish VPN tunnels to different VPN Internet servers but not to the same server. The advantage of disabling the PPTP ALG is to increase VPN performance. Enabling the PPTP ALG also allows incoming VPN connections to a LAN side VPN server (refer to [Virtual Server](#)).

### **IPSec (VPN)**

Allows multiple VPN clients to connect to their corporate networks using IPSec. Some VPN clients support traversal of IPSec through NAT. This option may interfere with the operation of such VPN clients. If you are having trouble connecting with your corporate network, try disabling this option.

Check with the system administrator of your corporate network whether your VPN client supports NAT traversal.

Note that L2TP VPN connections typically use IPSec to secure the connection. To achieve multiple VPN pass-through in this case, the IPSec ALG must be enabled.

### **RTSP**

Allows applications that use Real Time Streaming Protocol to receive streaming media from the internet. QuickTime and Real Player are some of the common applications using this protocol.

## **Windows/MSN Messenger**

Supports use on LAN computers of Microsoft Windows Messenger (the Internet messaging client that ships with Microsoft Windows) and MSN Messenger. The SIP ALG must also be enabled when the Windows Messenger ALG is enabled.

## **FTP**

Allows FTP clients and servers to transfer data across NAT. Refer to the [Advanced → Virtual Server](#) page if you want to host an FTP server.

## **H.323 (Netmeeting)**

Allows H.323 (specifically Microsoft Netmeeting) clients to communicate across NAT. Note that if you want your buddies to call you, you should also set up a virtual server for NetMeeting. Refer to the [Advanced → Virtual Server](#) page for information on how to set up a virtual server.

## **SIP**

Allows devices and applications using VoIP (Voice over IP) to communicate across NAT. Some VoIP applications and devices have the ability to discover NAT devices and work around them. This ALG may interfere with the operation of such devices. If you are having trouble making VoIP calls, try turning this ALG off.

## **Wake-On-LAN**

This feature enables forwarding of "magic packets" (that is, specially formatted wake-up packets) from the WAN to a LAN computer or other device that is "Wake on LAN" (WOL) capable. The WOL device must be defined as such on the [Advanced → Virtual Server](#) page. The LAN IP address for the virtual server is typically set to the broadcast address 192.168.10.255. The computer on the LAN whose MAC address is contained in the magic packet will be awakened.

## **MMS**

Allows Windows Media Player, using MMS protocol, to receive streaming media from the internet.

## Advanced Inbound Filter

When you use the Virtual Server, Gaming, or Remote Administration features to open specific ports to traffic from the Internet, you could be increasing the exposure of your LAN to cyber attacks from the Internet. In these cases, you can use Inbound Filters to limit that exposure by specifying the IP addresses of internet hosts that you trust to access your LAN through the ports that you have opened. You might, for example, only allow access to a game server on your home LAN from the computers of friends whom you have invited to play the games on that server.

Inbound Filters can be used for limiting access to a server on your network to a system or group of systems. Filter rules can be used with Virtual Server, Gaming, or Remote Administration features. Each filter can be used for several functions; for example a "Game Clan" filter might allow all of the members of a particular gaming group to play several different games for which gaming entries have been created. At the same time an "Admin" filter might only allow systems from your office network to access the WAN admin pages and an FTP server you use at home. If you add an IP address to a filter, the change is effected in all of the places where the filter is used.

## Inbound Filter

The Inbound Filter option is an advanced method of controlling data received from the Internet. With this feature you can configure inbound data filtering rules that control data based on an IP address range.

Inbound Filters can be used for limiting access to a server on your network to a system or group of systems. Filter rules can be used with Virtual Server, Port Forwarding, or Remote Administration features.

**Save Settings**      **Don't Save Settings**

### Add Inbound Filter Rule

Name :	<input type="text" value=""/>		
Action :	<input type="button" value="Deny"/>		
	Enable	Source IP Start	Source IP End
Source IP Range :	<input type="checkbox"/>	<input type="text" value="0.0.0.0"/>	<input type="text" value="255.255.255.255"/>
	<input type="checkbox"/>	<input type="text" value="0.0.0.0"/>	<input type="text" value="255.255.255.255"/>
	<input type="checkbox"/>	<input type="text" value="0.0.0.0"/>	<input type="text" value="255.255.255.255"/>
	<input type="checkbox"/>	<input type="text" value="0.0.0.0"/>	<input type="text" value="255.255.255.255"/>
	<input type="checkbox"/>	<input type="text" value="0.0.0.0"/>	<input type="text" value="255.255.255.255"/>
	<input type="checkbox"/>	<input type="text" value="0.0.0.0"/>	<input type="text" value="255.255.255.255"/>

**Save**      **Clear**

### Inbound Filter Rules List

Name	Action	Source IP Range
------	--------	-----------------

## Add/Edit Inbound Filter Rule

Here you can add entries to the Inbound Filter Rules List below, or edit existing entries.

### Name

Enter a name for the rule that is meaningful to you.

### Action

The rule can either Allow or Deny messages.

### Source IP Range

Define the ranges of Internet addresses this rule applies to. For a single IP address, enter the same address in both the **Start** and **End** boxes. Up to eight ranges can be entered.

The **Enable** checkbox allows you to turn on or off specific entries in the list of ranges.

### Save

Saves the new or edited Inbound Filter Rule in the following list. When finished updating the Inbound Filter Rules List, you must still click the **Save Settings** button at the top of the page to make the changes effective and permanent.

## Inbound Filter Rules List

The section lists the current Inbound Filter Rules. An Inbound Filter Rule can be changed by clicking the Edit icon, or deleted by clicking the Delete icon. When you click the Edit icon, the item is highlighted, and the "Edit Inbound Filter Rule" section is activated for editing.

In addition to the filters listed here, two predefined filters are available wherever inbound filters can be applied:

### Allow All

Permit any WAN user to access the related capability.

### Deny All

Prevent all WAN users from accessing the related capability. (LAN users are not affected by Inbound Filter Rules.)

# Advanced\_Advanced Wireless

The screenshot shows the configuration interface for a TRENDnet TEW-633GR Wireless N Gigabit Router. The top header displays the TRENDnet logo and the model name "Wireless N Gigabit Router TEW-633GR". The left sidebar contains a navigation menu with the following items: Basic, Advanced (selected), Virtual Server, Special Applications, Gaming, Streamengine, Routing, Access Control, Web Filter, MAC Address Filter, Firewall, Inbound Filter, Advanced Wireless (selected), Advanced Network, WISH, and Wi-Fi Protected Setup. Below the menu are two buttons: Save Settings and Don't Save Settings. The main content area is titled "Advanced Wireless Settings" and includes the following configuration options:

Setting	Value	Range
Transmit Power	High	
Beacon Period	100	(20..1000)
RTS Threshold	2346	(1..65535)
Fragmentation Threshold	2346	(256..65535)
DTIM Interval	1	(1..255)
Short GI	<input checked="" type="checkbox"/>	
WDS Enable	<input type="checkbox"/>	

## Transmit Power

Normally the wireless transmitter operates at 100% power. In some circumstances, however, there might be a need to isolate specific frequencies to a smaller area. By reducing the power of the radio, you can prevent transmissions from reaching beyond your corporate/home office or designated wireless area.

## Beacon Period

Beacons are packets sent by a wireless router to synchronize wireless devices. Specify a Beacon Period value between 20 and 1000. The default value is set to 100 milliseconds.

## RTS Threshold

This setting should remain at its default value of 2346. If you encounter inconsistent data flow, only minor modifications to the value are recommended.

## Fragmentation Threshold

This setting should remain at its default value of 2346. Setting the Fragmentation value too low may result in poor performance.

## DTIM Interval

A DTIM is a countdown informing clients of the next window for listening to broadcast and multicast messages. When the wireless router has buffered broadcast or multicast messages for associated clients, it sends the next DTIM with a DTIM Interval value. Wireless clients detect the beacons and awaken to receive the broadcast and multicast messages. The default value is 1. Valid settings are between 1 and 255.

## **Short GI**

Using a short (400ns) guard interval can increase throughput. However, it can also increase error rate in some installations, due to increased sensitivity to radio-frequency reflections. Select the option that works best for your installation.

## **Extra Wireless Protection**

Extra protection for neighboring 11b wireless networks. Turn this option off to reduce the adverse effect of legacy wireless networks on 802.11ng performance.

## **WDS Enable**

When WDS is enabled, this access point functions as a wireless repeater and is able to wirelessly communicate with other APs via WDS links. Note that WDS is incompatible with WPA -- both features cannot be used at the same time. A WDS link is bidirectional; so this AP must know the MAC Address (creates the WDS link) of the other AP, and the other AP must have a WDS link back to this AP. Make sure the APs are configured with same channel number.

## **WDS AP MAC Address**

Specifies one-half of the WDS link. The other AP must also have the MAC address of this AP to create the WDS link back to this AP. Enter a MAC address for each of the other APs that you want to connect with WDS.

# Advanced\_Network

If you are not familiar with these Advanced Network settings, please read the help section before attempting to modify these settings.

**UPnP**  
Universal Plug and Play (UPnP) supports peer-to-peer Plug and Play functionality for network devices.

**Enable UPnP :**

**WAN Ping**  
If you enable this feature, the WAN port of your router will respond to ping requests from the Internet that are sent to the WAN IP Address.

**Enable WAN Ping Respond:**

**WAN Ping Inbound Filter :** Allow All  Details  Everyone allows

**WAN Port Speed**  
WAN Port Speed: Auto 10/100/1000Mbps

**Multicast Streams**  
Enable Multicast Streams:

Copyright © 2007 TRENDnet. All Rights Reserved.

## UPnP

UPnP is short for Universal Plug and Play, which is a networking architecture that provides compatibility among networking equipment, software, and peripherals. This router has optional UPnP capability, and can work with other UPnP devices and software.

### Enable UPnP

If you need to use the UPnP functionality, you can enable it here.

## WAN Ping

Pinging public WAN IP addresses is a common method used by hackers to test whether your WAN IP address is valid.

### Enable WAN Ping Respond

If you leave this option unchecked, you are causing the router to ignore **ping** commands for the public WAN IP address of the router.

## WAN Port Speed

Normally, this is set to "auto". If you have trouble connecting to the WAN, try the other settings.

## Multicast Streams

The router uses the IGMP protocol to support efficient multicasting -- transmission of identical content, such as multimedia, from a source to a number of recipients.

### Enable Multicast Streams

This option must be enabled if any applications on the LAN participate in a multicast group. If you have a multimedia LAN application that is not receiving content as expected, try enabling this option.

# Advanced\_ WISH

WISH is short for Wireless Intelligent Stream Handling, a technology developed to enhance your experience of using a wireless network by prioritizing the traffic of different applications.

## WISH

### Enable WISH

Enable this option if you want to allow WISH to prioritize your traffic.

### Priority Classifiers

#### HTTP

Allows the router to recognize HTTP transfers for many common audio and video streams and prioritize them above other traffic. Such streams are frequently used by digital media players.

## **Windows Media Center**

Enables the router to recognize certain audio and video streams generated by a Windows Media Center PC and to prioritize these above other traffic. Such streams are used by systems known as Windows Media Extenders, such as the Xbox 360.

## **Automatic**

When enabled, this option causes the router to automatically attempt to prioritize traffic streams that it doesn't otherwise recognize, based on the behaviour that the streams exhibit. This acts to deprioritize streams that exhibit bulk transfer characteristics, such as file transfers, while leaving interactive traffic, such as gaming or VoIP, running at a normal priority.

## **Add/Edit WISH Rule**

A WISH Rule identifies a specific message flow and assigns a priority to that flow. For most applications, the priority classifiers ensure the right priorities and specific WISH Rules are not required.

WISH supports overlaps between rules. If more than one rule matches for a specific message flow, the rule with the highest priority will be used.

### **Enable**

Specifies whether the entry will be active or inactive.

### **Name**

Create a name for the rule that is meaningful to you.

### **Priority**

The priority of the message flow is entered here. Four priorities are defined:

- BK: Background (least urgent).
- BE: Best Effort.
- VI: Video.
- VO: Voice (most urgent).

### **Protocol**

The protocol used by the messages.

### **Host 1 IP Range**

The rule applies to a flow of messages for which one computer's IP address falls within the range set here.

### **Host 1 Port Range**

The rule applies to a flow of messages for which host 1's port number is within the range set here.

### **Host 2 IP Range**

The rule applies to a flow of messages for which the other computer's IP address falls within the range set here.

## **Host 2 Port Range**

The rule applies to a flow of messages for which host 2's port number is within the range set here.

### **Save/Update**

Record the changes you have made into the following list.

### **Clear**

Re-initialize this area of the screen, discarding any changes you have made.

## **WISH Rules**

This section lists the defined WISH Rules. Click the Enable checkbox at the left to directly activate or de-activate the entry. An entry can be changed by clicking the Edit icon or can be deleted by clicking the Delete icon. When you click the Edit icon, the item is highlighted, and the "Edit WISH Rule" section is activated for editing.

# Advanced\_ Wi-Fi Protected Setup

## Wi-Fi Protected Setup

### Enable

Enable the Wi-Fi Protected Setup feature.

### Lock Wireless Security Settings

Locking the wireless security settings prevents the settings from being changed by any new external registrar using its PIN. Devices can still be added to the wireless network using Wi-Fi Protected Setup. It is still possible to change wireless network settings with [Manual Wireless Network Setup](#), [Wireless Network Setup Wizard](#), or an existing external WLAN Manager Registrar.

## PIN Settings

A PIN is a unique number that can be used to add the router to an existing network or to create a new network. The default PIN may be printed on the bottom of the router. For extra security, a new PIN can be generated. You can restore the default PIN at any time. Only the Administrator ("admin" account) can change or reset the PIN.

### Current PIN

Shows the current value of the router's PIN.

### Reset PIN to Default

Restore the default PIN of the router.

## **Generate New PIN**

Create a random number that is a valid PIN. This becomes the router's PIN. You can then copy this PIN to the user interface of the registrar.

## **Add Wireless Station**

This Wizard helps you add wireless devices to the wireless network.

The wizard will either display the wireless network settings to guide you through manual configuration, prompt you to enter the PIN for the device, or ask you to press the configuration button on the device. If the device supports Wi-Fi Protected Setup and has a configuration button, you can add it to the network by pressing the configuration button on the device and then the on the router within 60 seconds. The status LED on the router will flash three times if the device has been successfully added to the network.

There are several ways to add a wireless device to your network. Access to the wireless network is controlled by a "registrar". A registrar only allows devices onto the wireless network if you have entered the PIN, or pressed a special Wi-Fi Protected Setup button on the device. The router acts as a registrar for the network, although other devices may act as a registrar as well.

## **Add Wireless Device Wizard**

Start the wizard.

# Tools

The Tools tab provides the following configuration options: **Admin, Time, Email Settings, System, Firmware, Dynamic DNS, Windows Connect Now, System Check & Schedules.**

## Tools\_Admin

The Admin option is used to set a password for access to the Web-based management. By default there is no password configured. It is highly recommended that you create a password to keep your new router secure.

The screenshot shows the 'Administrator Settings' page of the TRENDnet TEW-633GR. The left sidebar has a 'Tools' section selected, which includes options like Admin, Time, Email Settings, System, Firmware, Dynamic DNS, System Check, and Schedules. The main content area is titled 'Administrator Settings' and contains sections for 'Admin Password' and 'User Password'. Both sections instruct the user to enter the same password into both boxes for confirmation. Below these are fields for 'System Name' (Gateway Name: TRENDnet, Inc. TEW-63) and 'Administration' settings (Inactivity Time Out: 15 minutes, Enable Remote Management: checked, Remote Admin Port: 8080, Remote Admin Inbound Filter: Allow All, Details: Allow All). At the bottom right, it says 'Copyright © 2007 TRENDnet. All Rights Reserved.'

Wireless N Gigabit Router  
TEW-633GR

- Time
- Email Settings
- System
- Firmware
- Dynamic DNS
- System Check
- Schedules

**Status**

**Help**

**Administrator Settings**

The 'admin' and 'user' accounts can access the management interface. The admin has read/write access and can change passwords, while the user has read-only access.

By default there is no password configured. It is highly recommended that you create a password to keep your router secure.

**Save Settings**   **Don't Save Settings**

**Admin Password**

Please enter the same password into both boxes, for confirmation.

Password :	<input type="text"/>
Verify Password :	<input type="text"/>

**User Password**

Please enter the same password into both boxes, for confirmation.

Password :	<input type="text"/>
Verify Password :	<input type="text"/>

**System Name**

Gateway Name : TRENDnet, Inc. TEW-63

**Administration**

Inactivity Time Out :	15	(minutes)
Enable Remote Management :	<input checked="" type="checkbox"/>	
Remote Admin Port :	8080	
Remote Admin Inbound Filter :	Allow All	
Details :	Allow All	

Copyright © 2007 TRENDnet. All Rights Reserved.

## **Admin Password**

Enter a password for the user "admin", who will have full access to the Web-based management interface.

## **User Password**

Enter a password for the user "user", who will have read-only access to the Web-based management interface.

## **Gateway Name**

The name of the router can be changed here.

## **Enable Remote Management**

Enabling Remote Management allows you to manage the router from anywhere on the Internet. Disabling Remote Management allows you to manage the router only from computers on your LAN.

## **Remote Admin Port**

The port that you will use to address the management interface from the Internet. For example, if you specify port 1080 here, then, to access the router from the Internet, you would use a URL of the form: **http://my.domain.com:1080/**.

## **Remote Admin Inbound Filter**

Select a filter that controls access as needed for this admin port. If you do not see the filter you need in the list of filters, go to the [Advanced → Inbound Filter](#) screen and create a new filter.

# Tools\_Time

The Time Configuration option allows you to configure, update, and maintain the correct time on the router's internal system clock. From this section you can set the time zone that you are in and set the Time Server. Daylight saving can also be configured to automatically adjust the time when needed.

## Time Configuration

### Current Router Time

Displays the time currently maintained by the router. If this is not correct, use the following options to configure the time correctly.

### Time Zone

Select your local time zone from pull down menu.

### Enable Daylight Saving

Check this option if your location observes daylight saving time.

### Daylight Saving Offset

Select the time offset, if your location observes daylight saving time.

### DST Start and DST End

Select the starting and ending times for the change to and from daylight saving time. For example, suppose for DST Start you select Month="Oct", Week="3rd", Day="Sun" and Time="2am". This is the same as saying: "Daylight saving starts on the third Sunday of October at 2:00 AM."

## Automatic Time Configuration

### Enable NTP Server

Select this option if you want to synchronize the router's clock to a Network Time Server over the Internet. If you are using schedules or logs, this is the best way to ensure that the schedules and logs are kept accurate.

### NTP Server Used

Select a Network Time Server for synchronization. You can type in the address of a time server or select one from the list. If you have trouble using one server, select another.

### Set the Date and Time Manually

If you do not have the NTP Server option in effect, you can either manually set the time for your router here, or you can click the **Copy Your Computer's Time Settings** button to copy the time from the computer you are using. (Make sure that computer's time is set correctly.)

If the router loses power for any reason, it cannot keep its clock running, and will not have the correct time when it is started again. To maintain correct time for schedules and logs, either you must enter the correct time after you restart the router, or you must enable the NTP Server option.

# Tools\_Email Settings

The Email feature can be used to send the system log files, router alert messages, and firmware update notification to your email address.

The screenshot shows the 'Email Settings' configuration page. On the left, a vertical menu bar includes 'Basic', 'Advanced', 'Tools' (which is selected and highlighted in blue), 'System', 'Firmware', 'Dynamic DNS', 'System Check', 'Schedules', 'Status', and 'Help'. The main panel has a title 'EMail Settings' and a descriptive text: 'The Email feature can be used to send the system log files, router alert messages, and firmware update notification to your email address.' Below this are two buttons: 'Save Settings' and 'Don't Save Settings'. The configuration area is divided into sections: 'Enable' (with 'Enable Email Notification' checked), 'Email Settings' (with fields for 'From Email Address', 'To Email Address', 'SMTP Server Address', and 'Enable Authentication'), and 'Email log when FULL or on Schedule' (with options for 'On Log Full' and 'On Schedule', and a dropdown menu for 'Schedule' set to 'Never'). At the bottom right of the main panel is the copyright notice: 'Copyright © 2007 TRENDnet. All Rights Reserved.'

## Enable

### Enable Email Notification

When this option is enabled, router activity logs or firmware upgrade notifications can be emailed to a designated email address, and the following parameters are displayed.

## Email Settings

### From Email Address

This email address will appear as the sender when you receive a log file or firmware upgrade notification via email.

### To Email Address

Enter the email address where you want the email sent.

### SMTP Server Address

Enter the SMTP server address for sending email.

### Enable Authentication

If your SMTP server requires authentication, select this option.

**Account Name**

Enter your account for sending email.

**Password**

Enter the password associated with the account.

**Verify Password**

Re-type the password associated with the account.

**Email Log When Full or on Schedule****On Log Full**

Select this option if you want logs to be sent by email when the log is full.

**On Schedule**

Select this option if you want logs to be sent by email according to a schedule.

**Schedule**

If you selected the On Schedule option, select one of the defined schedule rules. If you do not see the schedule you need in the list of schedules, go to the [Tools -> Schedules](#) screen and create a new schedule.

Normally email is sent at the start time defined for a schedule, and the schedule end time is not used. However, rebooting the router during the schedule period will cause additional emails to be sent.

# Tools\_System

This section allows you to manage the router's configuration settings, reboot the router, and restore the router to the factory default settings. Restoring the unit to the factory default settings will erase all settings, including any rules that you've created.

## Save Settings To Local Hard Drive

This option allows you to save the router's configuration to a file on your computer. Be sure to save the configuration before performing a firmware upgrade.

## Load Settings From Local Hard Drive

Use this option to restore previously saved router configuration settings.

## Restore To Factory Default Settings

This option restores all configuration settings back to the settings that were in effect at the time the router was shipped from the factory. Any settings that have not been saved will be lost. If you want to save your router configuration settings, use the Save Settings option above.

## Reboot The Device

This restarts the router. Useful for restarting when you are not near the device.

## Tools\_Firmware

The Firmware Upgrade section can be used to update to the latest firmware code to improve functionality and performance. To check for the latest firmware, click the **Check Online Now** button. If you would like to be notified when new firmware is released, place a checkmark in the box next to **Email Notification of Newer Firmware Version**.

To upgrade the firmware, follow these steps:

1. Click the **Browse** button to locate the upgrade file on your computer.
2. Once you have found the file to be used, click the **Upload** button below to start the firmware upgrade process. This can take a minute or more.
3. Wait for the router to reboot. This can take another minute or more.
4. Confirm updated firmware revision on status page.

### Firmware Information

Here are displayed the version numbers of the firmware currently installed in your router and the most recent upgrade that is available.

### Check Online

This option will check support site to see if you have the latest version of the firmware available. If a newer version is available, download instructions will be displayed.

## Firmware Upgrade

Firmware upgrade cannot be performed from a wireless device. To perform an upgrade, ensure that you are using a PC that is connected to the router by wire.

Some firmware upgrades reset the configuration options to the factory defaults. Before performing an upgrade, be sure to save the current configuration from the [Tools -> Admin](#) screen.

## Upload

Once you have a firmware update on your computer, use this option to browse for the file and then upload the information into the router.

## Tools\_Dynamic DNS

The Dynamic DNS feature allows you to host a server (Web, FTP, Game Server, etc.) using a domain name that you have purchased ([www.whateveryournameis.com](http://www.whateveryournameis.com)) with your dynamically assigned IP address. Most broadband Internet Service Providers assign dynamic (changing) IP addresses. When you use a Dynamic DNS service provider, your friends can enter your host name to connect to your server, no matter what your IP address is.

### Enable Dynamic DNS

Enable this option only if you have purchased your own domain name and registered with a dynamic DNS service provider. The following parameters are displayed when the option is enabled.

#### Server Address

Select a dynamic DNS service provider from the pull-down list.

#### Host Name

Enter your host name, fully qualified; for example: **myhost.mydomain.net**.

#### Username or Key

Enter the username or key provided by your service provider. If the Dynamic DNS provider supplies only a key, enter that key in all three fields.

#### Password or Key

Enter the password or key provided by your service provider. If the Dynamic DNS provider supplies only a key, enter that key in all three fields.

## Verify Password or Key

Re-type the password or key provided by your service provider. If the Dynamic DNS provider supplies only a key, enter that key in all three fields.

## Timeout

The time between periodic updates to the Dynamic DNS, if your dynamic IP address has not changed. The timeout period is entered in hours.

If a dynamic DNS update fails for any reason (for example, when incorrect parameters are entered), the router automatically disables the Dynamic DNS feature and records the failure in the log.

After configuring the router for dynamic DNS, you can open a browser and navigate to the URL for your domain (for example <http://www.mydomain.info>) and the router will attempt to forward the request to port 80 on your LAN. If, however, you do this from a LAN-side computer and there is no virtual server defined for port 80, the router will return the router's configuration home page. Refer to the [Advanced -> Virtual Server](#) configuration page to set up a virtual server.

# Tools\_System Check

## Ping Test

"Ping" is an Internet utility function that sends a series of short messages to a target computer and reports the results. You can use it to test whether a computer is running, and to get an idea of the quality of the connection to that computer, based on the speed of the responses.

### Host Name or IP Address

Enter either the IP address of the target computer or enter its fully qualified domain name.

### Ping

Start pinging the specified host.

### Stop

The host is pinged repeatedly until you press this button.

### Example:

#### Host Name or IP Address

www.whitehouse.gov

#### Ping Result

Please wait, resolving www.whitehouse.gov....

Resolved to 205.161.7.102.

Response from 205.161.7.102 received in 7 milliseconds.

Response from 205.161.7.102 received in 6 milliseconds.

Response from 205.161.7.102 received in 7 milliseconds.

User stopped ping.

# Tools\_Schedules

Schedules can be created for use with enforcing rules. For example, if you want to restrict web access to Mon-Fri from 3pm to 8pm, you could create a schedule selecting Mon, Tue, Wed, Thu, and Fri and enter a Start Time of 3pm and End Time of 8pm.

The screenshot shows a software interface for managing schedules. On the left, a vertical menu bar includes 'Basic', 'Advanced', 'Tools' (which is selected), 'Status', and 'Help'. Under 'Tools', there are links for Admin, Time, Email Settings, System, Firmware, Dynamic DNS, System Check, and Schedules. The main window title is 'Schedules'. A sub-section titled 'Schedule configuration option is used to manage schedule rules for various firewall and parental control features.' contains two buttons: 'Save Settings' and 'Don't Save Settings'. Below this is the 'Add Schedule Rule' section. It has fields for 'Name' (with a yellow input field), 'Day(s)' (radio buttons for 'All Week' and 'Select Day(s)', with 'Select Day(s)' selected and checkboxes for Sun through Sat), 'All Day - 24 hrs' (checkbox), 'Start Time' (time input fields set to 12:00 AM), and 'End Time' (time input fields set to 12:00 AM). At the bottom are 'Save' and 'Clear' buttons. Below the rule form is a 'Schedule Rules List' table with columns for Name, Day(s), and Time Frame, but it is currently empty. The footer of the window displays 'Copyright © 2007 TRENDnet. All Rights Reserved.'

## Add/Edit Schedule Rule

In this section you can add entries to the Schedule Rules List below or edit existing entries.

### Name

Give the schedule a name that is meaningful to you, such as "Weekday rule".

### Day(s)

Place a checkmark in the boxes for the desired days or select the All Week radio button to select all seven days of the week.

### All Day - 24 hrs

Select this option if you want this schedule in effect all day for the selected day(s).

### Start Time

If you don't use the All Day option, then you enter the time here. The start time is entered in two fields. The first box is for the hour and the second box is for the minute. Email events are normally triggered only by the start time.

### End Time

The end time is entered in the same format as the start time. The hour in the first box and the minutes in the second box. The end time is used for most other rules, but is not normally used for email events.

## **Save**

Saves the new or edited Schedule Rule in the following list. When finished updating the Schedule Rules, you must still click the **Save Settings** button at the top of the page to make the changes effective and permanent.

## **Schedule Rules List**

This section shows the currently defined Schedule Rules. A Schedule Rule can be changed by clicking the Edit icon, or deleted by clicking the Delete icon. When you click the Edit icon, the item is highlighted, and the "Edit Schedule Rule" section is activated for editing.

# Status

The Status tab provides the following configuration options: **Device Info**, **Wireless**, **Routing**, **Logs**, **Statistics** and **Active Sessions**.

## Status\_Device info

All of your Internet and network connection details are displayed on the Device Info page. The firmware version is also displayed here.

Some browsers have limitations that make it impossible to update the WAN status display when the status changes. Some browsers require that you refresh the display to obtain updated status. Some browsers report an error condition when trying to obtain WAN status.

The screenshot shows the 'Device Information' page of the TRENDnet TEW-633GR router's web interface. The left sidebar has buttons for Basic, Advanced, Tools, and Status, with Status selected. Under Status, there are links for Device Info, Wireless, Routing, Logs, Statistics, Active Sessions, and WISH Sessions. The main content area is titled 'Device Information' and contains a message: 'All of your Internet and network connection details are displayed on this page. The firmware version is also displayed here.' Below this is a 'General' section with fields for Time (Saturday, January 31, 2004 11:26:12 AM) and Firmware Version (1.0.0.4, 9 Aug 2007). The 'WAN' section includes fields for Connection Type (DHCP Client), Cable Status (Disconnected), Network Status (Disconnected), and Connection Up Time (N/A). At the bottom are 'DHCP Renew' and 'DHCP Release' buttons. Further down are fields for MAC Address (00:11:E0:02:DF:BA), IP Address (0.0.0.0), Subnet Mask (0.0.0.0), Default Gateway (0.0.0.0), and Primary DNS Server (0.0.0.0).

Depending on the type of WAN connection, you can take one of the following sets of actions:

### DHCP Connection

Clicking the **DHCP Release** button releases the router's IP address. The router will not respond to IP messages from the WAN side until you click the **DHCP Renew** button or power-up the router again. Clicking the **DHCP Renew** button causes the router to request a new IP address from the ISP's server.

## **PPPoE, PPTP, L2TP Connection**

Depending on whether the WAN connection is currently established, you can click either the **Connect** to attempt to establish the WAN connection or the **Disconnect** to break the WAN connection.

## **BigPond Connection**

Depending on whether you are currently logged in to BigPond, you can click either the **BigPond Login** to attempt to establish the WAN connection or the **BigPond Logout** to break the WAN connection.

## **LAN Computers**

This area of the screen continually updates to show all DHCP enabled computers and devices connected to the LAN side of your router. The detection "range" is limited to the address range as configured in DHCP Server. Computers that have an address outside of this range will not show. If the DHCP Client (i.e. a computer configured to "Obtain an address automatically") supplies a Host Name then that will also be shown. Any computer or device that has a static IP address that lies within the detection "range" may show, however its host name will not.

## **IGMP Multicast memberships**

If IGMP is enabled, this area of the screen shows all multicast groups of which any LAN devices are members.

## Status\_Wireless

The wireless section allows you to view the wireless clients that are connected to your wireless router.

The screenshot shows the 'Associated Wireless Client List' page. At the top right, it says 'Wireless N Gigabit Router' and 'TEW-633GR'. On the left, there's a navigation menu with 'Basic', 'Advanced', 'Tools', 'Status' (which is selected), and 'Help'. Under 'Status', there are links for 'Device Info', 'Wireless' (underlined), 'Routing', 'Logs', 'Statistics', 'Active Sessions', and 'WISH Sessions'. The main area has a title 'Associated Wireless Client List' and a sub-instruction 'Use this option to view the wireless clients that are connected to your wireless router.' Below that, it shows 'Number Of Wireless Clients : 0' and a table header row with columns for 'MAC Address', 'IP Address', 'Mode', 'Rate', and 'Signal (%)'.

### MAC Address

The Ethernet ID (MAC address) of the wireless client.

### IP Address

The LAN-side IP address of the client.

### Mode

The transmission standard being used by the client. Values are 11b, or 11g for 802.11b, or 802.11g respectively.

### Rate

The actual transmission rate of the client in megabits per second.

### Signal

This is a relative measure of signal quality. The value is expressed as a percentage of theoretical best quality. Signal quality can be reduced by distance, by interference from other radio-frequency sources (such as cordless telephones or neighboring wireless networks), and by obstacles between the router and the wireless device.

## Status\_Routing

The routing section displays all of the routing details configured for your router.

The screenshot shows the router's configuration interface. The top header includes the TRENDnet logo and the model name "Wireless N Gigabit Router TEW-633GR". The left sidebar has a "Status" menu item selected, which contains links for Device Info, Wireless, Routing (underlined), Logs, Statistics, Active Sessions, and WISH Sessions. The main content area is titled "Routing" and displays a message: "This page displays the routing details configured for your router." Below this is a "Routing Table" with the following data:

Destination IP	Netmask	Gateway	Metric	Interface	Creator
192.168.1.0	255.255.255.0	0.0.0.0	1	LAN	System

At the bottom right of the content area, the copyright notice "Copyright © 2007 TRENDnet. All Rights Reserved." is visible.

A value of 0.0.0.0 for gateway means there is no next hop, and the IP address is directly connected to the router on the interface specified: LAN or WAN. A value of 0.0.0.0 in both the destination IP and netmask means that this is the default route.

## Status\_Logs

The router automatically logs (records) events of possible interest in its internal memory. If there is not enough internal memory for all events, logs of older events are deleted, but logs of the latest events are retained. The Logs option allows you to view the router logs. You can define what types of events you want to view and the level of events to view. This router also has external Syslog Server support so you can send the log files to a computer on your network that is running a Syslog utility.

The screenshot shows the 'System Logs' configuration interface. On the left is a vertical menu bar with options: Basic, Advanced, Tools, Status (which is selected), and Help. The 'Status' menu includes links for Device Info, Wireless, Routing, Logs (selected), Statistics, Active Sessions, and WISH Sessions. The main area is titled 'System Logs' and contains a descriptive text box: 'Use this option to view the router logs. You can define what types of events you want to view and the event levels to view. This router also has external syslog server support so you can send the log files to a computer on your network that is running a syslog utility.' Below this is a 'Log Options' section with two tables. The first table, 'What to View:', has three checked checkboxes: Firewall & Security, System, and Router Status. The second table, 'View Levels:', has three checked checkboxes: Critical, Warning, and Informational. A large 'Apply Log Settings Now' button is located at the bottom of this section. Below these tables is a 'Log Details' section with four buttons: Refresh, Clear, Email Now, and Save Log. A scrollable text area displays log entries:

```
[INFO] Sat Jan 31 11:28:28 2004 Log viewed by IP address 192.168.1.67  
[INFO] Sat Jan 31 10:41:41 2004 Allowed configuration authentication by IP address 192.168.1.67  
[INFO] Sat Jan 31 10:31:18 2004 LAN interface is up  
[INFO] Sat Jan 31 10:31:18 2004 LAN Ethernet Carrier Detected  
[INFO] Sat Jan 31 10:31:18 2004 Device initialized  
[INFO] Sat Jan 31 10:31:18 2004 Wireless Link is up  
[INFO] Sat Jan 31 10:31:17 2004 Unlock AP setup  
[INFO] Sat Jan 31 10:31:17 2004 No Internet access policy is in effect. Unrestricted Internet access allowed to everyone  
[INFO] Wed Dec 31 16:00:00 1969 Loaded configuration from non-volatile memory
```

Copyright © 2007 TRENDnet. All Rights Reserved.

### What to View

Select the kinds of events that you want to view.

- Firewall and Security
- System
- Router Status

## **View Levels**

Select the level of events that you want to view.

- Critical
- Warning
- Informational

## **Apply Log Settings Now**

Click this button after changing Log Options to make them effective and permanent.

## **Refresh**

Clicking this button refreshes the display of log entries. There may be new events since the last time you accessed the log.

## **Clear**

Clicking this button erases all log entries.

## **Email Now**

If you provided email information with the [Tools -> Email](#) screen, clicking the **Email Now** button sends the router log to the configured email address.

## **Save Log**

Select this option to save the router log to a file on your computer.

# Status\_Statistics

The Statistics page displays all of the LAN, WAN, and Wireless packet transmit and receive statistics.

The screenshot shows a web-based interface for network traffic statistics. On the left is a vertical menu bar with buttons for Basic, Advanced, Tools, Status (which is selected), and Help. The main content area has a title "Network Traffic Stats" and a sub-instruction "Traffic Statistics display Receive and Transmit packets passing through your router." Below this are three sections: "LAN Statistics", "WAN Statistics", and "Wireless Statistics". Each section contains a table with the following data:

LAN Statistics	
Sent :	7003
TX Packets Dropped :	0
Collisions :	0
Received :	25912
RX Packets Dropped :	0
Errors :	0

WAN Statistics	
Sent :	1346
TX Packets Dropped :	0
Collisions :	0
Received :	0
RX Packets Dropped :	0
Errors :	0

Wireless Statistics	
Sent :	20929
TX Packets Dropped :	0
Received :	0
RX Packets Dropped :	0
Errors :	26

At the bottom right of the main content area, there is a copyright notice: "Copyright © 2007 TRENDnet. All Rights Reserved."

## Sent

The number of packets sent from the router.

## Received

The number of packets received by the router.

## TX Packets Dropped

The number of packets that were dropped while being sent, due to errors, collisions, or router resource limitations.

## RX Packets Dropped

The number of packets that were dropped while being received, due to errors, collisions, or router resource limitations.

## Collisions

The number of packets that were dropped due to Ethernet collisions (two or more devices attempting to use an Ethernet circuit at the same time).

## Errors

The number of transmission failures that cause loss of a packet. A noisy radio-frequency environment can cause a high error rate on the wireless LAN.

# Status\_Active Sessions

The Active Sessions page displays full details of active sessions through your router. A session is a conversation between a program or application on a LAN-side computer and a program or application on a WAN-side computer.

The screenshot shows the 'Active Sessions' page of the TRENDnet TEW-633GR router's web interface. The top navigation bar includes the TRENDNET logo and the model name 'Wireless N Gigabit Router TEW-633GR'. On the left, a vertical menu bar lists 'Basic', 'Advanced', 'Tools', 'Status' (which is selected), and 'Help'. The 'Status' menu contains links for 'Device Info', 'Wireless', 'Routing', 'Logs', 'Statistics', 'Active Sessions' (which is also selected), and 'WISH Sessions'. The main content area is titled 'Active Sessions' and contains a sub-header: 'This page displays the full details of active internet sessions to your router.' Below this is a table header with columns: Internal, Protocol, External, NAT, Priority, State, Dir, and Time Out. At the bottom right of the page, there is a copyright notice: 'Copyright © 2007 TRENDnet. All Rights Reserved.'

## Internal

The IP address and port number of the LAN-side application.

## Protocol

The communications protocol used for the conversation.

## External

The IP address and port number of the WAN-side application.

## NAT

The port number of the LAN-side application as viewed by the WAN-side application.

## Priority

The preference given to outbound packets of this conversation by the StreamEngine logic. Smaller numbers represent higher priority.

## **State**

State for sessions that use the TCP protocol.

- NO: None -- This entry is used as a placeholder for a future connection that may occur.
- SS: SYN Sent -- One of the systems is attempting to start a connection.
- EST: Established -- the connection is passing data.
- FW: FIN Wait -- The client system has requested that the connection be stopped.
- CW: Close Wait -- the server system has requested that the connection be stopped.
- TW: Time Wait -- Waiting for a short time while a connection that was in FIN Wait is fully closed.
- LA: Last ACK -- Waiting for a short time while a connection that was in Close Wait is fully closed.
- CL: Closed -- The connection is no longer active but the session is being tracked in case there are any retransmitted packets still pending.

## **Dir**

The direction of initiation of the conversation:

### **Out**

Initiated from LAN to WAN.

### **In**

Initiated from WAN to LAN.

## **Time Out**

The number of seconds of idle time until the router considers the session terminated. The initial value of Time Out depends on the type and state of the connection.

### **300 seconds**

UDP connections.

### **20 seconds**

Reset or closed TCP connections. The connection does not close instantly so that lingering packets can pass or the connection can be re-established.

### **120 seconds**

Opening or closing TCP connections.

### **7800 seconds**

Established TCP connections.

# Status\_WISH Sessions

The WISH Sessions page displays full details of active local wireless sessions through your router when WISH has been enabled. A WISH session is a conversation between a program or application on a wirelessly connected LAN-side computer and another computer, however connected.

The screenshot shows the 'WISH Sessions' page of the TRENDnet TEW-633GR router's web interface. The left sidebar has a 'Status' section selected, which includes options like Device Info, Wireless, Routing, Logs, Statistics, Active Sessions, and WISH Sessions. The main content area is titled 'WISH Sessions' and contains a brief description of what it does. Below that is a table header with columns: Originator, Target, Protocol, State, Priority, and Time Out.

## Originator

The IP address and, where appropriate, port number of the computer that originated a network connection.

## Target

The IP address and, where appropriate, port number of the computer to which a network connection has been made.

## Protocol

The communications protocol used for the conversation.

## State

State for sessions that use the TCP protocol.

- NO: None -- This entry is used as a placeholder for a future connection that may occur.
- SS: SYN Sent -- One of the systems is attempting to start a connection.
- EST: Established -- the connection is passing data.
- FW: FIN Wait -- The client system has requested that the connection be stopped.
- CW: Close Wait -- the server system has requested that the connection be stopped.
- TW: Time Wait -- Waiting for a short time while a connection that was in FIN Wait is fully closed.

- LA: Last ACK -- Waiting for a short time while a connection that was in Close Wait is fully closed.
- CL: Closed -- The connection is no longer active but the session is being tracked in case there are any retransmitted packets still pending.

## Priority

The priority given to packets sent wirelessly over this conversation by the WISH logic. The priorities are:

- BK: Background (least urgent).
- BE: Best Effort.
- VI: Video.
- VO: Voice (most urgent).

## Time Out

The number of seconds of idle time until the router considers the session terminated. The initial value of Time Out depends on the type and state of the connection.

### **300 seconds**

UDP connections.

### **240 seconds**

Reset or closed TCP connections. The connection does not close instantly so that lingering packets can pass or the connection can be re-established.

### **7800 seconds**

Established or closing TCP connections.

# Glossary

8

## 802.11

A family of specifications for wireless local area networks (WLANs) developed by a working group of the Institute of Electrical and Electronics Engineers (IEEE).

A

### Access Control List

ACL. This is a database of network devices that are allowed to access resources on the network.

### Access Point

AP. Device that allows wireless clients to connect to it and access the network

### ActiveX

A Microsoft specification for the interaction of software components.

### Address Resolution Protocol

ARP. Used to map MAC addresses to IP addresses so that conversions can be made in both directions.

### Ad-hoc network

Peer-to-Peer network between wireless clients

### ADSL

Asymmetric Digital Subscriber Line

### Advanced Encryption Standard

AES. Government encryption standard

### Alphanumeric

Characters A-Z and 0-9

### Antenna

Used to transmit and receive RF signals.

### AppleTalk

A set of Local Area Network protocols developed by Apple for their computer systems

### AppleTalk Address Resolution Protocol

AARP. Used to map the MAC addresses of Apple computers to their AppleTalk network addresses, so that conversions can be made in both directions.

### Application layer

7th Layer of the OSI model. Provides services to applications to ensure that they can communicate properly with other applications on a network.

## **ASCII**

American Standard Code for Information Interchange. This system of characters is most commonly used for text files

## **Attenuation**

The loss in strength of digital and analog signals. The loss is greater when the signal is being transmitted over long distances.

## **Authentication**

To provide credentials, like a Password, in order to verify that the person or device is really who they are claiming to be

## **Automatic Private IP Addressing**

APIPA. An IP address that a Windows computer will assign itself when it is configured to obtain an IP address automatically but no DHCP server is available on the network

# **B**

## **Backward Compatible**

The ability for new devices to communicate and interact with older legacy devices to guarantee interoperability

## **Bandwidth**

The maximum amount of bytes or bits per second that can be transmitted to and from a network device

## **Basic Input/Output System**

BIOS. A program that the processor of a computer uses to startup the system once it is turned on

## **Baud**

Data transmission speed

## **Beacon**

A data frame by which one of the stations in a Wi-Fi network periodically broadcasts network control data to other wireless stations.

## **Bit rate**

The amount of bits that pass in given amount of time

## **Bit/sec**

Bits per second

## **BOOTP**

Bootstrap Protocol. Allows for computers to be booted up and given an IP address with no user intervention

## **Bottleneck**

A time during processes when something causes the process to slowdown or stop all together

## **Broadband**

A wide band of frequencies available for transmitting data

## **Broadcast**

Transmitting data in all directions at once

## **Browser**

A program that allows you to access resources on the web and provides them to you graphically

# **C**

## **Cable modem**

A device that allows you to connect a computer up to a coaxial cable and receive Internet access from your Cable provider

## **CardBus**

A newer version of the PC Card or PCMCIA interface. It supports a 32-bit data path, DMA, and consumes less voltage

## **CAT 5**

Category 5. Used for 10/100 Mbps or 1Gbps Ethernet connections

## **Client**

A program or user that requests data from a server

## **Collision**

When do two devices on the same Ethernet network try and transmit data at the exact same time.

## **Cookie**

Information that is stored on the hard drive of your computer that holds your preferences to the site that gave your computer the cookie

# **D**

## **Data**

Information that has been translated into binary so that it can be processed or moved to another device

## **Data Encryption Standard**

Uses a randomly selected 56-bit key that must be known by both the sender and the receiver when information is exchanged

## **Database**

Organizes information so that it can be managed updated, as well as easily accessed by users or applications.

## **Data-Link layer**

The second layer of the OSI model. Controls the movement of data on the physical link of a network

**DB-25**

A 25 pin male connector for attaching External modems or RS-232 serial devices

**DB-9**

A 9 pin connector for RS-232 connections

**dBd**

Decibels related to dipole antenna

**dBi**

Decibels relative to isotropic radiator

**dBm**

Decibels relative to one milliwatt

**Decrypt**

To unscramble an encrypted message back into plain text

**Default**

A predetermined value or setting that is used by a program when no user input has been entered for this value or setting

**Demilitarized zone**

DMZ: A single computer or group of computers that can be accessed by both users on the Internet as well as users on the Local Network, but that is not protected by the same security as the Local Network.

**DHCP**

Dynamic Host Configuration Protocol: Used to automatically assign IP addresses from a predefined pool of addresses to computers or devices that request them

**Digital certificate:**

An electronic method of providing credentials to a server in order to have access to it or a network

**Direct Sequence Spread Spectrum**

DSSS: Modulation technique used by 802.11b wireless devices

**DMZ**

"Demilitarized Zone". A computer that logically sits in a "no-mans land" between the LAN and the WAN. The DMZ computer trades some of the protection of the router's security mechanisms for the convenience of being directly addressable from the Internet.

**DNS**

Domain Name System: Translates Domain Names to IP addresses

**Domain name**

A name that is associated with an IP address

**Download**

To send a request from one computer to another and have the file transmitted back to the requesting computer

## **DSL**

Digital Subscriber Line. High bandwidth Internet connection over telephone lines

## **Duplex**

Sending and Receiving data transmissions at the same time

## **Dynamic DNS service**

Dynamic DNS is provided by companies to allow users with Dynamic IP addresses to obtain a Domain Name that will always be linked to their changing IP address. The IP address is updated by either client software running on a computer or by a router that supports Dynamic DNS, whenever the IP address changes

## **Dynamic IP address**

IP address that is assigned by a DHCP server and that may change. Cable Internet providers usually use this method to assign IP addresses to their customers.

## **E**

### **EAP**

Extensible Authentication Protocol

### **Email**

Electronic Mail is a computer-stored message that is transmitted over the Internet

### **Encryption**

Converting data into ciphertext so that it cannot be easily read

### **Ethernet**

The most widely used technology for Local Area Networks.

## **F**

### **Fiber optic**

A way of sending data through light impulses over glass or plastic wire or fiber

### **File server**

A computer on a network that stores data so that the other computers on the network can all access it

### **File sharing**

Allowing data from computers on a network to be accessed by other computers on the network with different levels of access rights

### **Firewall**

A device that protects resources of the Local Area Network from unauthorized users outside of the local network

### **Firmware**

**Programming** that is inserted into a hardware device that tells it how to function

## **Fragmentation**

Breaking up data into smaller pieces to make it easier to store

## **FTP**

File Transfer Protocol. Easiest way to transfer files between computers on the Internet

## **Full-duplex**

Sending and Receiving data at the same time

## **G**

### **Gain**

The amount an amplifier boosts the wireless signal

### **Gateway**

A device that connects your network to another, like the internet

### **Gbps**

Gigabits per second

### **Gigabit Ethernet**

Transmission technology that provides a data rate of 1 billion bits per second

## **GUI**

Graphical user interface

## **H**

### **H.323**

A standard that provides consistency of voice and video transmissions and compatibility for videoconferencing devices

### **Half-duplex**

Data cannot be transmitted and received at the same time

### **Hashing**

Transforming a string of characters into a shorter string with a predefined length

### **Hexadecimal**

Characters 0-9 and A-F

### **Hop**

The action of data packets being transmitted from one router to another

### **Host**

Computer on a network

### **HTTP**

Hypertext Transfer Protocol is used to transfer files from HTTP servers (web servers) to HTTP clients (web browsers)

## **HTTPS**

HTTP over SSL is used to encrypt and decrypt HTTP transmissions

## **Hub**

A networking device that connects multiple devices together

## **ICMP**

Internet Control Message Protocol

## **IEEE**

Institute of Electrical and Electronics Engineers

## **IGMP**

Internet Group Management Protocol is used to make sure that computers can report their multicast group membership to adjacent routers

## **IIS**

Internet Information Server is a WEB server and FTP server provided by Microsoft

## **IKE**

Internet Key Exchange is used to ensure security for VPN connections

## **Infrastructure**

In terms of a wireless network, this is when wireless clients use an Access Point to gain access to the network

## **Internet**

A system of worldwide networks which use TCP/IP to allow for resources to be accessed from computers around the world

## **Internet Explorer**

A World Wide Web browser created and provided by Microsoft

## **Internet Protocol**

The method of transferring data from one computer to another on the Internet

## **Internet Protocol Security**

IPsec provides security at the packet processing layer of network communication

## **Internet Service Provider**

An ISP provides access to the Internet to individuals or companies

## **Intranet**

A private network

## **Intrusion Detection**

**A** A type of security that scans a network to detect attacks coming from inside and outside of the network

## **I**

**IP** Internet Protocol

### **IP address**

A 32-bit number, when talking about Internet Protocol Version 4, that identifies each computer that transmits data on the Internet or on an Intranet

## **IPsec**

Internet Protocol Security

## **IPX**

Internetwork Packet Exchange is a networking protocol developed by Novell to enable their Netware clients and servers to communicate

## **ISP**

Internet Service Provider

## **J**

### **Java**

A programming language used to create programs and applets for web pages

## **K**

### **Kbps**

Kilobits per second

### **Kbyte**

Kilobyte

## **L**

### **L2TP**

Layer 2 Tunneling Protocol

### **LAN**

Local Area Network

### **Latency**

The amount of time that it takes a packet to get from the one point to another on a network.  
Also referred to as delay

### **LED**

Light Emitting Diode

### **Legacy**

Older devices or technology

## **Local Area Network**

A group of computers in a building that usually access files from a server

## **LPR/LPD**

"Line Printer Requestor"/"Line Printer Daemon". A TCP/IP protocol for transmitting streams of printer data.

## **M**

### **MAC Address**

A unique hardware ID assigned to every Ethernet adapter by the manufacturer.

### **Mbps**

Megabits per second

### **MDI**

Medium Dependent Interface is an Ethernet port for a connection to a straight-through cable

### **MDIX**

Medium Dependent Interface Crossover, is an Ethernet port for a connection to a crossover cable

### **MIB**

Management Information Base is a set of objects that can be managed by using SNMP

### **Modem**

A device that Modulates digital signals from a computer to an analog signal in order to transmit the signal over phone lines. It also Demodulates the analog signals coming from the phone lines to digital signals for your computer

### **MPPE**

Microsoft Point-to-Point Encryption is used to secure data transmissions over PPTP connections

### **MTU**

Maximum Transmission Unit is the largest packet that can be transmitted on a packet-based network like the Internet

### **Multicast**

Sending data from one device to many devices on a network

## **N**

### **NAT**

Network Address Translation allows many private IP addresses to connect to the Internet, or another network, through one IP address

### **NetBEUI**

NetBIOS Extended User Interface is a Local Area Network communication protocol. This is an updated version of NetBIOS

## **NetBIOS**

Network Basic Input/Output System

## **Netmask**

Determines what portion of an IP address designates the Network and which part designates the Host

## **Network Interface Card**

A card installed in a computer or built onto the motherboard that allows the computer to connect to a network

## **Network Layer**

The third layer of the OSI model which handles the routing of traffic on a network

## **Network Time Protocol**

Used to synchronize the time of all the computers in a network

## **NIC**

Network Interface Card

## **NTP**

Network Time Protocol

## **O**

### **OFDM**

Orthogonal Frequency-Division Multiplexing is the modulation technique for both 802.11a and 802.11g

### **OSI**

Open Systems Interconnection is the reference model for how data should travel between two devices on a network

### **OSPF**

Open Shortest Path First is a routing protocol that is used more than RIP in larger scale networks because only changes to the routing table are sent to all the other routers in the network as opposed to sending the entire routing table at a regular interval, which is how RIP functions

## **P**

### **Password**

A sequence of characters that is used to authenticate requests to resources on a network

### **Personal Area Network**

The interconnection of networking devices within a range of 10 meters

### **Physical layer**

The first layer of the OSI model. Provides the hardware means of transmitting electrical signals on a data carrier

## **Ping**

A utility program that verifies that a given Internet address exists and can receive messages. The utility sends a control packet to the given address and waits for a response.

## **PoE**

Power over Ethernet is the means of transmitting electricity over the unused pairs in a category 5 Ethernet cable

## **POP3**

Post Office Protocol 3 is used for receiving email

## **Port**

A logical channel endpoint in a network. A computer might have only one physical channel (its Ethernet channel) but can have multiple ports (logical channels) each identified by a number.

## **PPP**

Point-to-Point Protocol is used for two computers to communicate with each other over a serial interface, like a phone line

## **PPPoE**

Point-to-Point Protocol over Ethernet is used to connect multiple computers to a remote server over Ethernet

## **PPTP**

Point-to-Point Tunneling Protocol is used for creating VPN tunnels over the Internet between two networks

## **Preamble**

Used to synchronize communication timing between devices on a network

## **Q**

### **QoS**

Quality of Service

## **R**

### **RADIUS**

Remote Authentication Dial-In User Service allows for remote users to dial into a central server and be authenticated in order to access resources on a network

### **Reboot**

To restart a computer and reload its operating software or firmware from nonvolatile storage.

### **Rendezvous**

Apple's version of UPnP, which allows for devices on a network to discover each other and be connected without the need to configure any settings

### **Repeater**

Retransmits the signal of an Access Point in order to extend its coverage

**RIP**

Routing Information Protocol is used to synchronize the routing table of all the routers on a network

**RJ-11**

The most commonly used connection method for telephones

**RJ-45**

The most commonly used connection method for Ethernet

**RS-232C**

The interface for serial communication between computers and other related devices

**RSA**

Algorithm used for encryption and authentication

**S****Server**

A computer on a network that provides services and resources to other computers on the network

**Session key**

An encryption and decryption key that is generated for every communication session between two computers

**Session layer**

The fifth layer of the OSI model which coordinates the connection and communication between applications on both ends

**Simple Mail Transfer Protocol**

Used for sending and receiving email

**Simple Network Management Protocol**

Governs the management and monitoring of network devices

**SIP**

Session Initiation Protocol. A standard protocol for initiating a user session that involves multimedia content, such as voice or chat.

**SMTP**

Simple Mail Transfer Protocol

**SNMP**

Simple Network Management Protocol

**SOHO**

Small Office/Home Office

**SPI**

**Stateful Packet Inspection**

## **SSH**

Secure Shell is a command line interface that allows for secure connections to remote computers

## **SSID**

Service Set Identifier is a name for a wireless network

## **Stateful inspection**

A feature of a firewall that monitors outgoing and incoming traffic to make sure that only valid responses to outgoing requests are allowed to pass through the firewall

## **Subnet mask**

Determines what portion of an IP address designates the Network and which part designates the Host

## **Syslog**

System Logger -- a distributed logging interface for collecting in one place the logs from different sources. Originally written for UNIX, it is now available for other operating systems, including Windows.

# **T**

## **TCP**

Transmission Control Protocol

## **TCP Raw**

A TCP/IP protocol for transmitting streams of printer data.

## **TCP/IP**

Transmission Control Protocol/Internet Protocol

## **TFTP**

Trivial File Transfer Protocol is a utility used for transferring files that is simpler to use than FTP but with less features

## **Throughput**

The amount of data that can be transferred in a given time period

## **Traceroute**

A utility displays the routes between your computer and specific destination

# **U**

## **UDP**

User Datagram Protocol

## **Unicast**

Communication between a single sender and receiver

## **Universal Plug and Play**

A standard that allows network devices to discover each other and configure themselves to be a part of the network

## **Upgrade**

To install a more recent version of a software or firmware product

## **Upload**

To send a request from one computer to another and have a file transmitted from the requesting computer to the other

## **UPnP**

Universal Plug and Play

## **URL**

Uniform Resource Locator is a unique address for files accessible on the Internet

## **USB**

Universal Serial Bus

## **UTP**

Unshielded Twisted Pair

## **V**

### **Virtual Private Network**

VPN: A secure tunnel over the Internet to connect remote offices or users to their company's network

## **VLAN**

Virtual LAN

## **Voice over IP**

Sending voice information over the Internet as opposed to the PSTN

## **VoIP**

Voice over IP

## **W**

### **Wake on LAN**

Allows you to power up a computer though it's Network Interface Card

## **WAN**

Wide Area Network

## **WCN**

Windows Connect Now. A Microsoft method for configuring and bootstrapping wireless networking hardware (access points) and wireless clients, including PCs and other devices.

## **WDS**

**Wireless Distribution System.** A system that enables the interconnection of access points wirelessly.

## **Web browser**

A utility that allows you to view content and interact with all of the information on the World Wide Web

## **WEP**

**Wired Equivalent Privacy** is security for wireless networks that is supposed to be comparable to that of a wired network

## **Wide Area Network**

The larger network that your LAN is connected to, which may be the Internet itself, or a regional or corporate network

## **Wi-Fi**

Wireless Fidelity

## **Wi-Fi Protected Access**

An updated version of security for wireless networks that provides authentication as well as encryption

## **Wireless ISP**

A company that provides a broadband Internet connection over a wireless connection

## **Wireless LAN**

Connecting to a Local Area Network over one of the 802.11 wireless standards

## **WISP**

Wireless Internet Service Provider

## **WLAN**

Wireless Local Area Network

## **WPA**

Wi-Fi Protected Access. A Wi-Fi security enhancement that provides improved data encryption, relative to WEP.

## **X**

## **xDSL**

A generic term for the family of digital subscriber line (DSL) technologies, such as ADSL, HDSL, RADSL, and SDSL.

## **Y**

## **Yagi antenna**

A directional antenna used to concentrate wireless signals on a specific location

# Limited Warranty

TRENDnet warrants its products against defects in material and workmanship, under normal use and service, for the following lengths of time from the date of purchase.

TEW-633GR	3 years
-----------	---------

If a product does not operate as warranted above during the applicable warranty period, TRENDnet shall, at its option and expense, repair the defective product or deliver to customer an equivalent product to replace the defective item. All products that are replaced will become the property of TRENDnet. Replacement products may be new or reconditioned.

TRENDnet shall not be responsible for any software, firmware, information, or memory data of customer contained in, stored on, or integrated with any products returned to TRENDnet pursuant to any warranty.

There are no user serviceable parts inside the product. Do not remove or attempt to service the product through any unauthorized service center. This warranty is voided if (i) the product has been modified or repaired by any unauthorized service center, (ii) the product was subject to accident, abuse, or improper use (iii) the product was subject to conditions more severe than those specified in the manual.

Warranty service may be obtained by contacting TRENDnet office within the applicable warranty period for a Return Material Authorization (RMA) number, accompanied by a copy of the dated proof of the purchase. Products returned to TRENDnet must be pre-authorized by TRENDnet with RMA number marked on the outside of the package, and sent prepaid, insured and packaged appropriately for safe shipment.

**WARRANTIES EXCLUSIVE:** IF THE TRENDNET PRODUCT DOES NOT OPERATE AS WARRANTED ABOVE, THE CUSTOMER'S SOLE REMEDY SHALL BE, AT TRENDNET'S OPTION, REPAIR OR REPLACEMENT. THE FOREGOING WARRANTIES AND REMEDIES ARE EXCLUSIVE AND ARE IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, EITHER IN FACT OR BY OPERATION OF LAW, STATUTORY OR OTHERWISE, INCLUDING WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. TRENDNET NEITHER ASSUMES NOR AUTHORIZES ANY OTHER PERSON TO ASSUME FOR IT ANY OTHER LIABILITY IN CONNECTION WITH THE SALE, INSTALLATION, MAINTENANCE OR USE OF TRENDNET'S PRODUCTS.

TRENDNET SHALL NOT BE LIABLE UNDER THIS WARRANTY IF ITS TESTING AND EXAMINATION DISCLOSE THAT THE ALLEGED DEFECT IN THE PRODUCT DOES NOT EXIST OR WAS CAUSED BY CUSTOMER'S OR ANY THIRD PERSON'S MISUSE, NEGLECT, IMPROPER INSTALLATION OR TESTING, UNAUTHORIZED ATTEMPTS TO REPAIR OR MODIFY, OR ANY OTHER CAUSE BEYOND THE RANGE OF THE INTENDED USE, OR BY ACCIDENT, FIRE, LIGHTNING, OR OTHER HAZARD.

**LIMITATION OF LIABILITY:** TO THE FULL EXTENT ALLOWED BY LAW TRENDNET ALSO EXCLUDES FOR ITSELF AND ITS SUPPLIERS ANY LIABILITY, WHETHER BASED IN CONTRACT OR TORT (INCLUDING NEGLIGENCE), FOR INCIDENTAL, CONSEQUENTIAL, INDIRECT, SPECIAL, OR PUNITIVE DAMAGES OF ANY KIND, OR FOR LOSS OF REVENUE OR PROFITS, LOSS OF BUSINESS, LOSS OF INFORMATION OR DATA, OR OTHER FINANCIAL LOSS ARISING OUT OF OR IN CONNECTION WITH THE SALE, INSTALLATION, MAINTENANCE, USE, PERFORMANCE, FAILURE, OR INTERRUPTION OF THE POSSIBILITY OF SUCH DAMAGES, AND LIMITS ITS LIABILITY TO REPAIR, REPLACEMENT, OR REFUND OF THE PURCHASE PRICE PAID, AT TRENDNET'S OPTION. THIS DISCLAIMER OF LIABILITY FOR DAMAGES WILL NOT BE AFFECTED IF ANY REMEDY PROVIDED HEREIN SHALL FAIL OF ITS ESSENTIAL PURPOSE.

**Governing Law:** This Limited Warranty shall be governed by the laws of the state of California.

**Note:** AC/DC Power Adapter, Cooling Fan, Cables and Power Supply carry 1-Year Warranty

TRENDNET®

## TRENDnet Technical Support

### US • Canada

**Toll Free Telephone:** 1(866) 845-3673

24/7 Tech Support

### Europe (Germany • France • Italy • Spain • Switzerland • UK)

**Toll Free Telephone:** +00800 60 76 76 67

English/Espanol - 24/7

Francais/Deutsch - 11am-8pm, Monday - Friday MET

### Worldwide

**Telephone:** +(31) [0] 20 504 05 35

English/Espanol - 24/7

Francais/Deutsch - 11am-8pm, Monday - Friday MET
